

UR1986-25

1986/25. An atlas of Tasmania Department of Mines gravity station locations.

Volume 1. Common data base identifier maps.

J.W. Hudspeth

Abstract

This atlas comprises maps at various scales, with one map per identifier, covering the station locations of the Tasmania Department of Mines gravity data base.

INTRODUCTION

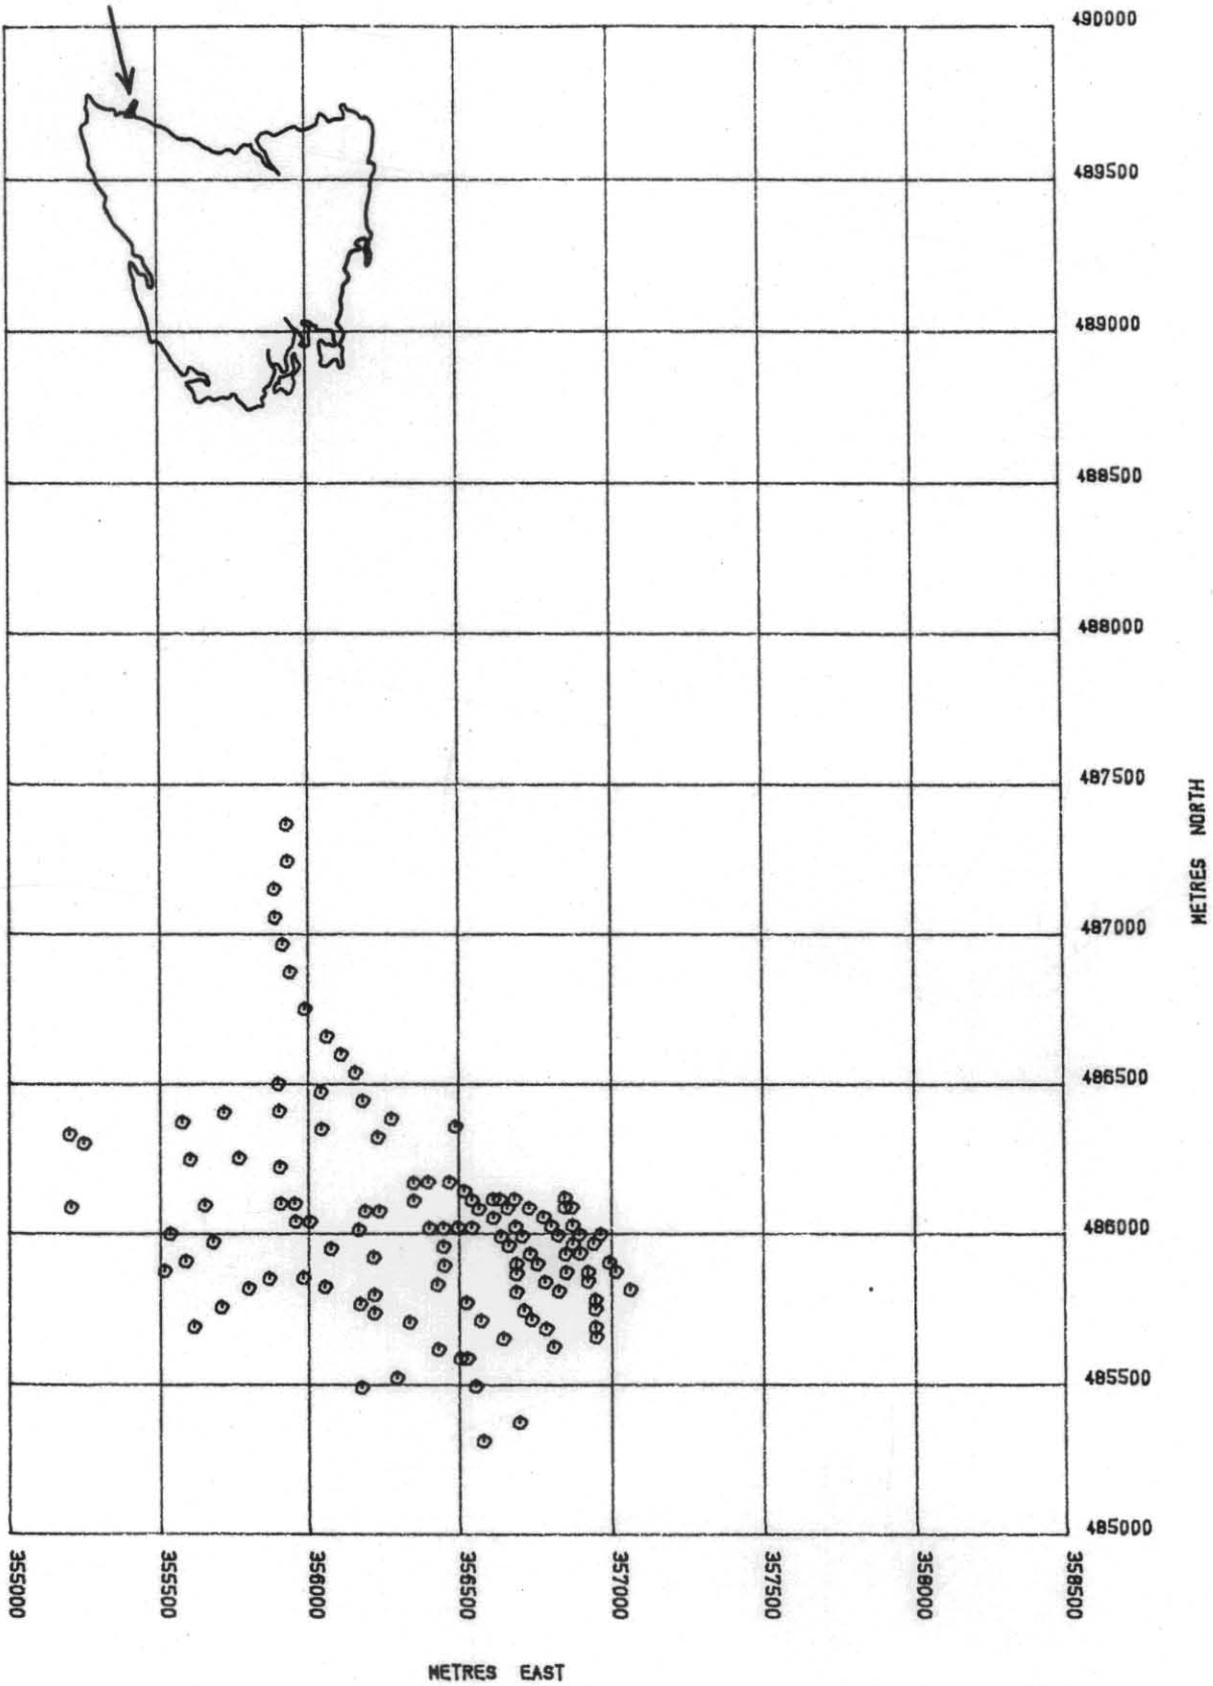

The Tasmania Department of Mines gravity data base is held as a file of about 23,000 stations (one station location per record). Each station location is associated with an identifier (which is part of each record). Station locations having a common identifier have been grouped together to form a map of station locations for that identifier.

The gravity data base file is currently classified as preliminary and in future the number of identifiers in use will probably be reduced. However the file currently contains much valuable gravity information, as all stations are terrain corrected. To assist potential users to find their way around the data base as it currently stands, this preliminary atlas is being produced now (February 1986) and will be complemented by a preliminary atlas of 35 km by 35 km quadrangles showing station locations (see Unpublished Report 1986/26).

THE MAPS

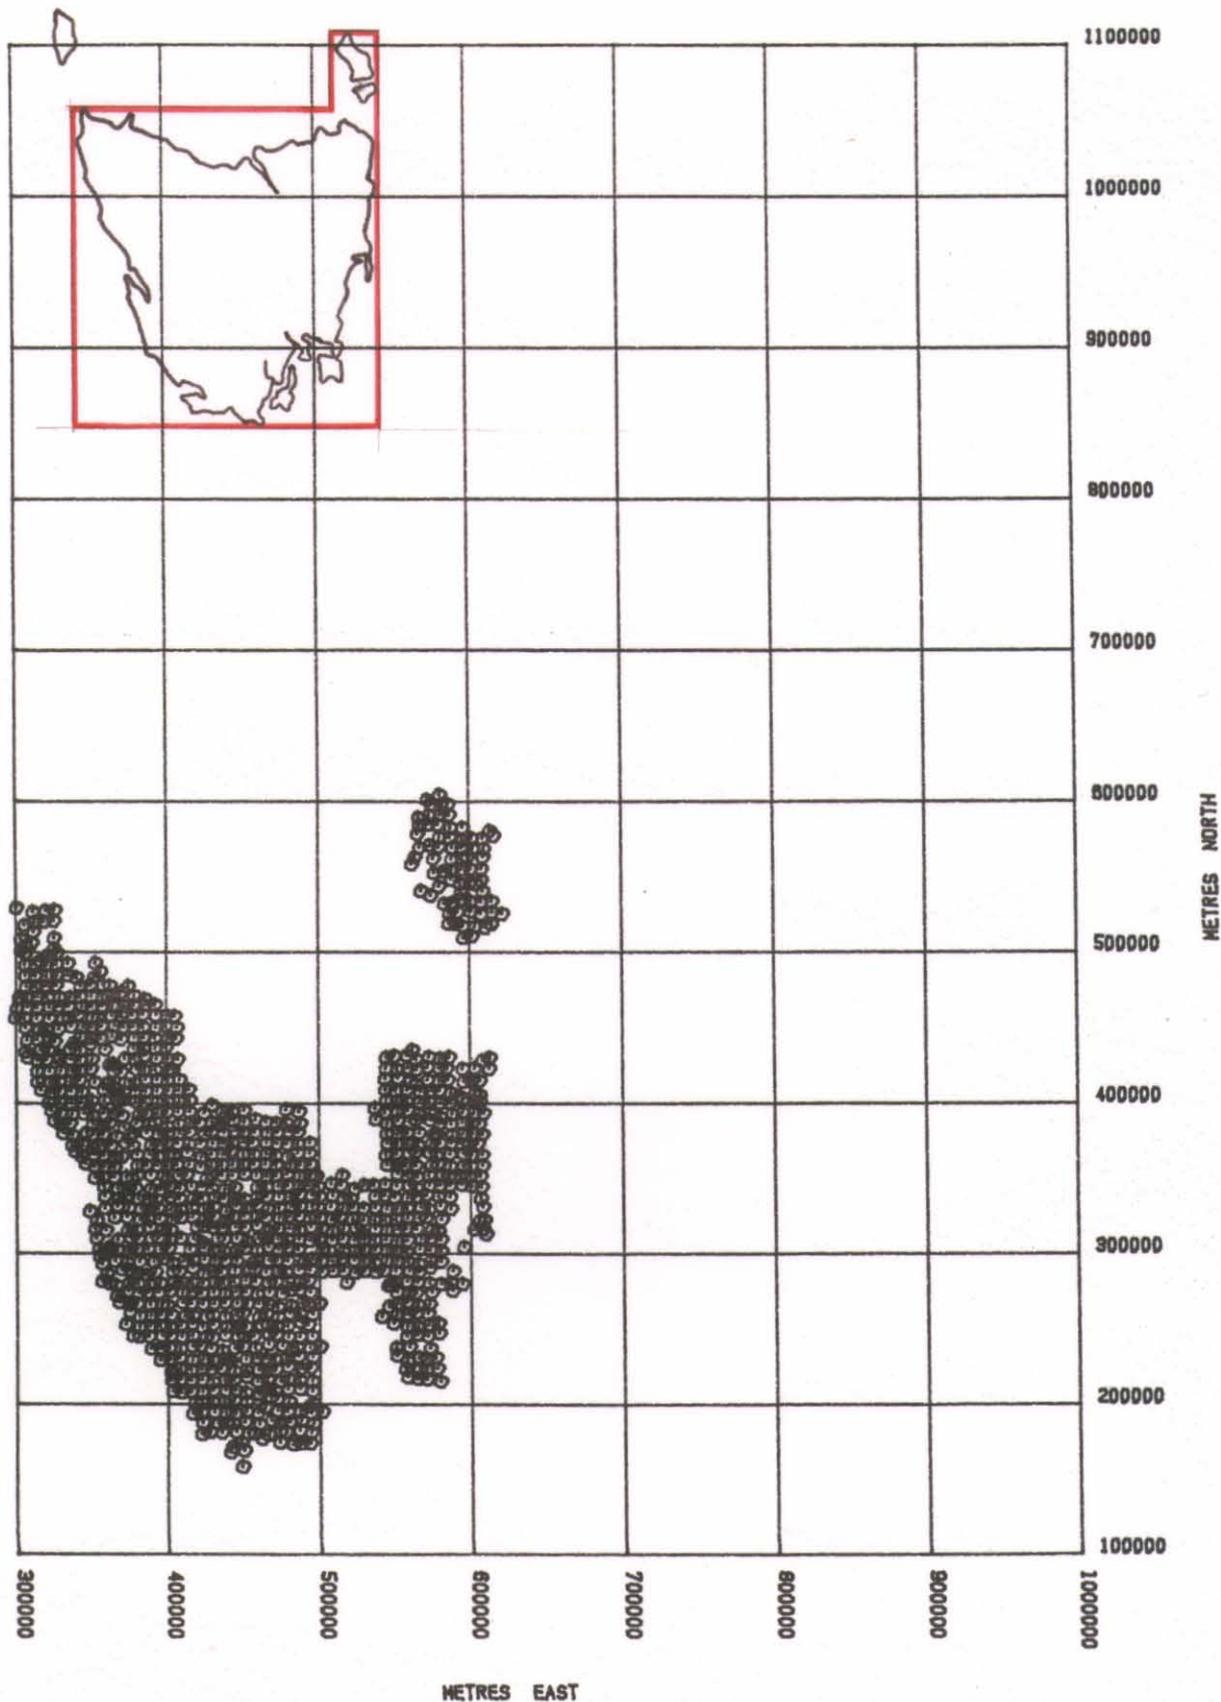

Each map is scaled to the maximum allowable scale subject to the grid being of a fixed shape and size on an A4 page. The scales chosen as allowable scales are 1 to 5000, 10 000, 25 000, 50 000, 100 000, 250 000, 500 000, 1 000 000, 2 500 000 and 5 000 000. The actual area of the predetermined grid occupied by the station locations is always as close as possible to the SW corner (bottom left hand corner of the grid on the page). The map title consists of the eight character (some of which may be blanks) identifier, the scale, the number of station locations, and AMG, signifying that the grid annotations pertain to the Australian Metric Grid. Superimposed on an unused part of the grid is a location map showing the location of the area on a map of Tasmania. Where appropriate, the location map indicates the general area occupied by the station locations shown, rather than the actual predetermined grid within which the points have been plotted.
