

ABSTRACT

A digital reflection and refraction marine seismic survey was conducted over parts of EPP VIC/P4 Victoria and T/1P Tasmania for Magellan Petroleum Australia Limited during May 1973.

Refraction results were of good to no record quality and reflection results of good to fair quality. Interpretation showed that Latrobe Valley Delta Complex rocks were present over all the area but no significant structural or stratigraphic traps were located. However, there is a possibility that stratigraphic traps exist within the Latrobe Valley Delta Complex unit and it is recommended that a detailed lithological study be undertaken and related back to the results herein contained in order to locate them.
