

REASONS FOR THE SURVEY

The program was designed to further explore two leads found during previous surveys. Lines NEF 1 and 2 were located to provide additional control on an east plunging nose and the remainder of the reflection work to examine the high occurring at the junction of the leases for structural closure of Latrobe Valley Delta Complex beds over it and/or stratigraphic traps on its flanks.

The refraction probes were to assist the reflection interpretation by determining the presence or absence of Latrobe Valley Delta Complex beds in the area of the probes.
