

entirely satisfactory, further high grade data being necessary. However, although the well appears to be on a reversal on line HO-23, there is little evidence for a reversal at this point on HO-21, although there are cross-cutting events on this section.

Mussel No. 1 is on the eastern edge of a large high, barely within the closed (7500) contour. Record quality is not very good in this area, even on the new shooting, and further new shooting would be needed to confirm this interpretation, although no major change would be expected.

It should be noted that in many areas the record quality is such that faults have probably been missed, and that these were only interpreted where there was substantial evidence of their existence.
