e. Common Depth Point (CDP) Gather

All data were output from the Pre-Processing
Module in CDP format. For the data now
reduced to 24-fold, each 24 trace output
record represented one CDP point.

f. Annotation

The offset and the shot plus receiver water
depth for each trace was annotated in channel
25 of the CDP gather record.

g. Preliminary Stack

Velocities obtained from previous years' process-
ing were applied to alternate depth points after
CDP gather and the data stacked. This post-
processing sequence omitted deconvolution.
Velocities from this year's work were used when
available.
