

These interpreted horizons were converted to depth using the stacking velocities (as if they were average velocities) from the panels at the top of the section.

Plate 3 is a SW-NE section through the southern 1:25,000 map sheet of this report. It was derived from line M20T, a 1969 seismic line reprocessed in 1980. A thicker sequence of L.C.M. is interpreted to overlie the basement highs in this area and consequently the detailing of structural leads by seismic profiles is preferred in this area rather than on those leads on the Northern Sheet. The time horizons from line M20T (reprocessed version) were converted to depth using the stacking velocities (as if they were average velocities) in the panels at the top of the section.
