BASS 1

Core 10, 5380-5400 ft

Core 10 - A gray/brown shale that grades up into a brown argillaceous medium-grained calcareous sand. Disseminated broken shell hash material throughout.

Core 11 (5880-5900 ft) Demons Bluff/Eastern View Transition

A black, organic, silt offshore/prodelta shales exhibiting localized calcareous zones and characteristic trace fossil Terebellina.

Core 12 (6405-6429 ft) N. asperous

A regressive coastal foreshore/lagoonal-back barrier/channel sequence. Foreshore/beach fine-grained sands are characterized by horizontal to low angle bedding ripple drift (antidunal?) and fluid escape structures grading up into bioturbated, wavy bedded lenticular sands and shales. A channel exhibiting mixed intra/interclast gravel lags truncates the underlying lagoonal sequence.

Core 13 (6930-6960A) P. asperpolus

An overall progradational sequence with numerous episodic bay/lake fills (debris-like flows) composed of gravels and coarse sands, deposited in bay/lake shales and lenticular sands. Overlying and transitional is a

mouth bar sequence characterized by wavy to lenticular bedded sands and shales grading up into upper fine flaser bedded sands.

Core 14 (7419-7443 ft) P. asperopolus

A series of very fine grain bay/lake fills associated with lake/bay shales and lenticular sands overlain by a flotan coal.

Core 15, (7692-7717 ft) M. diversus

An overall coarsening up sequence consisting of isolated thin, very fine-grained lagoonal/lake fills associated with lenticular sands and shales. A prograding fine to medium-grained minor mouth bar is characterized by flaser, low angle to horizontal and wavy bedding, thin coals (coffee grounds) and disseminated sideritic clasts.

BASS 2

Core 4 (3800-3822 ft) Demons Bluff

Gray/black heavily bioturbated, organic-rich offshore/prodelta shale. Contains local dolomitic and sideritic zones.

Core 5 (4131-4142 ft) N. asperus

Black carbonaceous, bioturbated, argillaceous very fine-grained to silty embayment/marsh sequence. Upper bluff portion is kaolinite (leached?) and contains carbonized rootlets.

Core 7 (4740-4762 ft) P. asperopolus

A series of fining up, medium to fine trough cross-bedded stacked channel sequences. Channels are dolomitic cemented.

Core 8 (5060-5076 ft) L. balmei

A series of episodic (storm events) very fine-grained lower shoreface sands associated with maroon sideritic lake shales. Horizontal to low angle and hummocky cross-stratification is common.

Core 9 (5508-5512 ft) L. balmei

Heat altered green shales and breccia zone overlain by fine-grained marsh sands and sideritic shales. Breccias are kaolinitic and are partially

reworked. Marsh zone is heavily bioturbated and contains numerous root-lets.

313117

BASS 3

Core 5 (5009-5035 ft) Demons Bluff

Black bioturbated (terebellina), organic rich, dolomitic offshore/prodelta shale.

Core 6 (5315-5335 ft) N. asperus

Heavily bioturbated, argillaceous, fine-grained lower shoreface sand.

Core 7 (5620-5642 ft) N. asperus

A transitional lower/middle shoreface, very fine-grained sand characterized by horizontal to low angle and hummocky cross-stratification. Local zones of heavy bioturbation identified as chrondrites and ophiomorphia.

Core 8 (5905-5919 ft) N. asperus

Argillaceous, carbonaceous, very fine-grained lagoonal/embayment/lake sands, exhibiting load casts, bioturbation, and wavy ripple bedding.

Core 9 (6420-6440 ft) L. balmei

Crevasse splays/bay-lake fills associated with dark gray bay/lake shales.

Core 10 (6903-6933 ft) L. balmei

A series of stacked channels (shallow subaqueous?, crevasse?) overlain by a crevasse splay and marsh sequences. Channel sands are medium to coarse grained and exhibit, horizontal, planar and contorted bedding. Marsh sediments exhibit abundant carbonaceous root structures.

Core 11 (7433-7453 ft) Late Cretaceous

Coarse to very coarse grained episodic debris flows characterized by contorted/convolute bedding and associated dark gray lake shales which are truncated by a fining up channel sequence. These coarse to fine-grained sands are characterized by trough cross-stratification and contorted bedding.

CORMORANT I

Cores 3 and 4 (4271-4306 ft) N. asperus

Fragmented and incompleted cores makes an environmental interpretation tenuous. The interval 4290-4306 ft is a coarsen up sequence grading from lenticular shales to a fine to medium-grained wavy bedded sand/shale sequence which becomes sandier at the top. A mouth bar sequence has been assigned to this interval; however, it can also be interpreted as shoreface to offshore. The short overlying shale sequence 4289-4290 ft contains lenticular sands with load casts and disturbed bedding typifying episodic events (storms?).

The overlying interval 4271-4281 ft was in tentatively interpreted as channels on the basis of medium to very fine fining up sand sequences.

Cores 5 and 6 (4935-4989 ft) N. asperus

A series of very fine to fine-grained coarsen up bay fills/splays associated with lenticular lake/bay shales overlying a flotan coal. Splays and fill commonly exhibit bioturbation and rootlets suggesting marsh-like conditions. A minor mouth bar (?) is interpreted to be at the top of the core.

Core 7 (5513-5540 ft) P. asperpolus

Dolomitic fine to medium-grained crevasse channel sand overlain by maroon shale with lenticular sands and a flotan(?) coal. The upper portion of the core overlying the coal is a transitional coarsen up sequence grading from a dark gray lake/embayment shale to very fine/fine bioturbated mouth bar sands.

Core 8 (5589-6019 ft) P. asperpolus

An overall progradation sequence consisting of regressive very fine to fine shoreface, beach/barrier sand overlain by a coal lagoonal/embayment sands and shales. Shoreface and barrier sand are characterized by horizontal to low angle and hummocky cross-stratified sand and carbonized rootlets at the top. Lagoonal sands fine upward and are bioturbated with flaser bedding grading into bioturbated lenticular shales. Marine dinoflagellate cysts were documented in this core.

Core 9 (6543-6562 ft) M. diversus

Bioturbated of shore/lake red/green shales with localized sand fills and lenticular ripples. Siderite concretions common.

Core 10 (7277-7327 ft) M. diversus

An argillaceous, very fine-grained rippled, bioturbated lagoonal sand overlying a coal.

Core 12 (8683-8693 ft) M. diversus

Lower shoreface/offshore lenticular shales with occasional sandy bay/lake fills.

Core 13 (90,997-9127 ft) M. diversus

An upward coarsening mouth bar sequence overlain by channel sequences. The mouth bar sequence characterized by lenticular, flaser and wavy bedding with herringbone-like structures. Channel floors are characterized by sideritic intraclast lags grading up into overlying wavy to flaser bedding.

DONDU - 1

Core 1 (7674-7730 ft) M. diversus

Core 1 represents a regressive coastal shoreface sequence. Lower shoreface sands are very fine-grained and exhibit storm events associated with low energy shales. Fine-grained middle shoreface sands are characterized by low angle cross bedding, scours, and hummocky cross-stratification grading up into bar sequences in the upper shoreface/foreshore. Beach/barrier sands grade from coarse to very coarse grained and are commonly horizontal to low angle planar bedded. Gray/black lagoonal shale with thin sand washovers cap the beach sequence.

DURROON 1

Core 3 (5547-5565 ft) Otway

4 (8373-8423 ft), Otway

5 (9905-9923 ft), Otway

Cores 3, 4, and 5 consist of a series of relatively thick unidirectional channel-like sequences. These green/gray volcanogenic sands are characterized by high angle bedding (30-40°), slump structures, massive/structureless sands and abundant isolated and matrix supported clasts. This grain flow/debris flow deposition suggests aproximal submarine fan origin.

KONKON 1

Core 1 (4411-4437 ft) M. diversus

A lacustrine red and green lenticular shale with lenticular sands, siderite concretions, and a thin coal.

NARIMBA-1

Core (9278-9306 ft) M. diversus

A channel abandonment sequence overlain by a flotan coal and bay/lake fill associated with gray lake/embayment shales and transitional lenticular sands. Channel sands are coarse to fine-grained with trough cross-bedded interclast log zones. Fine grain sands are heavily flaser, wavy and lenticular bedded. Bay/lake fill sands are very fine-grained and exhibit heavily rooted and bioturbated zones suggesting marsh-like conditions.

Core 2 (9542-9561 ft) M. diversus

Coarsening up, very fine to fine grained, crevasse splays/ bay lake fills overlain by a crevasse channel sequence containing sideritic intraclasts, bioturbation and rootlets. Upper portion of the core is interpreted as marsh.

Core 3 (9750-9756 ft) M. diversus

Lake/bay fills associated with maroon lake shales and lenticular wispy sands.

PELICAN 1

Core 1 (5600-5630 ft) demons bluff

Core 1 a black carbonaceous shale interpreted to be prodelta/offshore. Contains marine dinoflagellate cysts.

Core 2 (5840-5861 ft) N. asperus

Highly bioturbated argillaceous very fine-grained lower shoreface sands and silts. Trace fossils include chrondrites and teichichnus.

Core 3 (7110-7130 ft) P. asperopolus

A coarsening up crevasse splay sequence capped by a coal and gray/black organic-rich lagoonal/embayment shale. Plant fragments are common. Interpreted as Delta plain.

Core 4 (7749-7776 ft) M. diversus

Fine to very fine-grained abandonment sequence exhibiting lenticular and flaser bedding and overlain by black carbonaceous shales with intervening flotan coals.

Core 5 (8354-8390 ft) M. diversus

A series of coarsening up minor mouth bars/splays characterized by flaser/lenticular/wavy bedding and thin broken coal laminae.

Core 6 (8540-8570 ft) M. diversus

A coarsen up shoreface sequence characterized low angle planar bedding and hummocky cross-stratification and localized bioturbated zones. Grades up into foreshore/beach/barrier system with low angle to parallel bedding and rootlets. This is overlain by a lagoon/embayment shale and flotan coal.

Core 7 (9263-9283 ft) M. diversus

A series of coarsening-up estuary/embayment fill sands characterized by lenticular and wavy bedding and siderite concretions. Contains marine dinoflagellate cysts.

Core 8 (9426-9459 ft) M. diversus

Prograding stacked fluvial channel sequences overlying a shoreface/marsh facies. The coarse grained lower channel sands contain large (bank collapse) shale intraclast conglomerates and carbonized grass materials. The argillaceous shoreface sediments exhibit numerous vertical burrows, hummocky cross-stratification and low angle to horizontal planar stratification.

Core 9 (10058-10085 ft) M. diversus

Core 9 consists of a series of overall coarsening-up stacked fluvial channels. Lower sequences are channel abandonments characterized by medium-grained high angle planar bedded, and shale intraclast lags grading up into fine-grained sand exhibiting flaser, climbing and lenticular ripples.

Overlying coarse grained channel sands are trough cross-bedded and contain occasional thin coal laminae.

Core 10 (10387-103971 ft) L. balmei

A coarsening-up marsh sequence containing bioturbated organic-rich shales and coals with rootlets. Grades up into a very fine-grained argillaceous sands with abundant rootlets, water, escape structures and bioturbation.

PELICAN 2

Core 1 (9598-9620 ft) M. diversus

A very fine-grained argillaceous horizontal to low angle cross-bedded (hummocky cross-stratification?) bioturbated shoreface sand. Lower portion dominated by a series of episodic high energy events (storms?) with intervening bioturbation intervals. Siderite concretions and fluid escape structures are common.

Core 2 (9785-9810 ft) M. diversus

Gray coal embayment shales grading up fine-grained minor mouth bar sand (upper portion absent) overlain by a coal and organic rich shale.

Core 3 (9907-9931 ft) M. diversus

Crevasse splays associated with gray/green embayment shales. Splay sands are characteristically fine-grained, and exhibit burrows and carbonized rootlets suggesting marsh-like, organic-rich features. Sideritic sand (very fine-grained) noted at the bottom of the core.

PELICAN 3

Core 1 (9350-9398 ft) L. balmei

Core 1 consists of a series of isolated crevasse splays associated within embayment/lake facies. The bay/lake fills and crevasse splays are coarsening up sequences in which the sands are fine to very fine grained. These features commonly exhibit rootlets, escape structures, rippled and disturbed bedding and occasional siderite concretions. The embayment/lake sediments are transitional, reflecting waxing and waning currents, and commonly contain lenticular sands associated with the gray/black shales. The core top is capped by a trough cross-bedded, very coarse grained sand interpreted as a probable channel. Overall, this core appears to represent a regressive sequences.

Cores 2 and 3, (9420-9520 ft) L. balmei

Cores 2 and 3 are contiguous. The interval 9441-9520 ft represents a regressive or progradational sequence with the lower portion being comprised of a series of coarsening up lake/bay fills associated with sideritic shales. The remaining upper portion of the coarsening up interval is interpreted as a coastal shoreface/mouth bar sand grading up to a medium grained barrier system exhibiting well preserved carbonized rootlets and plants and capped by a thin coal. Shoreface sands are characterized by vertical (relatively high energy) burrows, horizontal to low angle cross-bedding and hummocky cross-stratification.

The overlying interval; 9420-9440 ft is a continuation of the lower regressive sequence with the progradational lagoonal, crevasse splays, and channel.

ANGLESEAS - 1

Core 1 (491-497 ft) N. asperus

Selected core samples of a black/brown coal.

Core 2 (791-799 ft) N. asperus

Selected core samples composed of kaolinitic silt with disseminated coal fragments.

Core 3 (1090-1093 ft) N. asperus

Selected core samples composed of kaolinitic coarse sand with disseminated coal fragments.

Core 4 (1214-1216 ft)

Selected core samples composed of kaolinitic silt with disseminated coal fragment and carbonized rootlets.

Core 5 (1506-1515 ft) Cretaceous

Kaolinitic fine to coarse grain sands and silt with disseminated coal fragments.

Core 6 (1778-1788 ft) Cretaceous

Selected core samples composed very fine to medium-grained sand with disseminated coal fragments.

Core 7 (1932-1949 ft) Otway

Selected core samples composed of fine to medium-grained sand exhibiting aggrading ripples load casts, contorted bedding and coal clasts.

PELICAN 4

Core 1, (9325-9365 ft) M. diversus

Core 1 is comprised of crevasse channels, splays, bay/lake fills and a minor mouth bar. The channels are commonly floored with sideritic shale lags (ripups) associated with trough cross-bedded medium grained sands which fine upward. Bay/lake fills and crevasse splay are thin gradational coarsening up sequences which are associated with the bay/lake shale facies. Thin lenticular (rippled) sands are common in transition zones. A relative thick coarsening up sand is located at the top and is interpreted to be a minor mouth bar sequence. This sequence is characterized by flaser, wavy, and contorted bedding in the fine grained sands and trough cross-bedding in the upper fine grained sands.

Core 2, (9564-9606 ft) M. diversus

Core 2 contains a series of isolated crevasse channels associated with embayment/lake shales. Thin coals (coffee grounds origin) were observed within levee deposits in addition to a thick coal unit, interpreted to be a flotan, located at the top of the core.

PELICAN 5

Core 1 2790.4-2808.1m (9155-9213 ft) M. diversus

A coarsen up very fine to medium grained minor mouth bar sand associated with maroon/brown lake/embayment shales which contain localized zones of lenticular rippled sands. Bar sands are wavy, flaser and horizontally bedded and are overlain by a crevasse channel, crevasse splays, bay/lake fills and embayment shales. An argillaceous very fine-grained bioturbated sand exhibiting contorted and wavy bedding grades up into homogeneous gray/green shale overlain by a flotan coal. Capping the sequence is a trough bedded medium-grained channel sand.

Cores 2 and 3 2863.6-2896.2m (9395-9491 ft) M. diversus

Contiguous cores that are a progradational sequence. Coarsen-up shoreface sands and shales exhibiting low angle to hummocky cross-stratification are truncated by thick series of stacked channels. These medium to fine-grained channel sands are characterized by large intraclasts (bank collapse) indistinict to massive zones, and planar to trough cross bedding. Lake/embayment very fine, bioturbated sands and shales cap the sequence.

POONBOON - 1

Core 2 (8096-8118 ft) M. diversus

A series of stacked fining up fluvial channels prograding across lake/embayment sediments and a flotan coal deposit. Through cross-bedded channel sands are commonly medium to coarse grained with large sideritic intraclasts as channel lags. Lake/embayment sediments are medium-grained sand fill associated with gray/black shales and lenticular sands and localized sideritic concretions.

Core 3 (8802-8827 ft) L. balmei

A progradational sequence consisting of a series of stacked fluvial channels overlying embayment and marsh sediments. Trough to horizontal bedded coarse grained channel sands have quartz pebble interclast lags and thin coal laminations (coffee grounds).

Marsh sands are fine-grained and exhibit abundant bioturbation and rootlets with overlying embayment sediments consisting principally of gray shale with sand fills.

Core 4 (9954-9982 ft) L. balmei

An embayment/lagoon facies infilled by a series of stacked crevasse channels embayment. Shales are black, organic rich and commonly contain abundant plant fragments and thin coal lamina. Crevasse channels are fine to

medium-grain fining up sequences which contain sideritic intraclasts and abundant rootlets and burrowing at their tops suggesting marsh-like conditions.

Core 5 (10,691-10,715 ft) Cretaceous

A homogeneous gray/black prodelta/offshore shale.

TOOLKA - 1

Core 1 (5089-5120 ft) N. asperus

Red to maroon bioturbated lake/embayment shales with lenticular sands and occasional siderite concretions.

YURONGI -1

Core 1 (7045-7075 ft) L. balmei

A regressive fine-grained middle to upper coastal shoreface sands characterized by episodic storm events, vertical burrows (skolithos) horizontal to low angle bedding, hummocky cross-stratification and contorted bedding.

NANGKERO 1

Core 1 (7390-7419 ft) M. diversus

Delta plain sequence comprised of bioturbated, rooted, very fine-grained marsh sands and coals overlain by a relatively thick wavy bedded-lenticular bedded very fine-grained lagoonal/embayment sands. Capped by a thick organic-rich shale exhibiting abundant plant fragments, rootlets, thin coals, and siderite.

TAROOK I

Core 1 (6426-6466 ft) N. aspersus

A regressive coastal sequence transiting from lower/middle/upper shoreface/foreshore/backshore/lagoon. Trace fossils include chandrites, skolithos and asterosoma and root zones.

Core 2 (8544-8576 ft) M. diversus

A transgresive shorface/offshore sequence characterized by Chrondrites, siderite concretions and flaser to wavy bedded, very fine-grained sands and lenticular sandy shales.

Core 3 (9080-9100 ft) M. diversus

A black organic-rich shale with flotan coal and thin crevasse splays. Computer rock zonation identifies soft rock volcanics.

AROO-1

Cores 1 and 2 (9515-9570 ft) L. balmei

A gray lagoon/lake sideritic shale lying beneath (in sharp contact) a series of very fine to fine-grain sands. These sands appear to be episodic and are characterized by horizontal to planar bedding, bioturbation (skolithes), contorted bedding and rootlets and are interpreted as shoreface/beach. However, because of the strong suggestion of organics (rootlets, siderite) a marsh-like environment has to be considered.

Overlying interbedded washover/beach and black lagoonal/marsh shales and bioturbated sands are truncated by a series of prograding stacked fluvial channels and interbedded coals. Fining-up channel sands exhibit trough and planar cross bedding and coal interclast lags.

YOLLA-1

Core 1 18629-1865.6m (6112-6121 ft) N. asperus

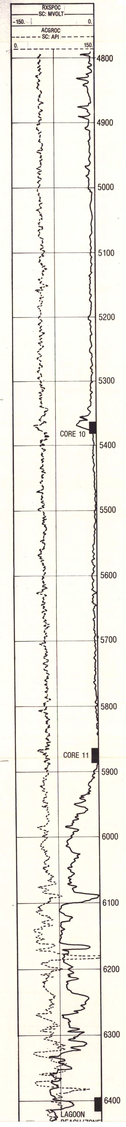
Heavily bioturbated very fine-grained lower/middle shoreface sand. Characteristic trace fossils present are asterosoma, ophiomorphia and teichichnus.

TILANA

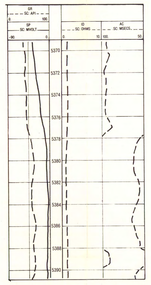
Core 1, 1665.0-1675.1m (5462-5495 ft) N. asperus

Core 1, approximately 33 ft of very fine to fine transgressive shoreface sands which can be subdivided into lower and middle shoreface. Middle shoreface sands lie above wavebase and exhibit contorted/convolute bedding and syngenetic fractures. Intraclasts (ripups), by their angular appearance, show little transport. Bioturbation is comprised of relatively high energy forms such as ophiomorphia.

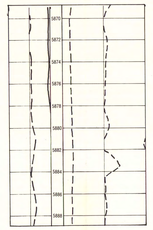
Finer grained lower shoreface sands contain increasing clay matrix (upwards) and are heavily bioturbated by the characteristic trace fossils asterosoma and chondrites.



Core 2, 2788.6-2807.26m (9146-9211 ft) L. balmei



Core 2, overall, is a regressive coastal sequence with the interval 9190-9211 ft representing a coarsening up package of shoreface and beach very fine to very coarse grained sands. Shoreface and bay sands are characterized by ripple bedded flasers and horizontal to planar crossbeds with gravel lags associated with interbar zones. High energy events (storm) are common to the shoreface. Swash zones on the beachface are characterized by alternating coarse/fine grained couplets with gravel logs within the runnel zones.



Fine to coarse grained sand sequences (9153-9186 ft) are primarily the result of unidirectional channelized flows and exhibit interformational (gravel) channel logs, occasional thin coals partings/coffee grounds), vertical burrows, aggrading and flaser ripple bedding, and horizontal to low angle and limited trough cross-bedding. At the top of the sequence lagoonal muds and coal overly a carbonized rootlet and burrowed sand interpreted as a barrier sequence.

SUBJECT: Transmittal of Geological Research Department Report F87-G-15 Entitled, "Chronostratigraphic Correlations of Subsurface Paleogene Sections, Bass Basin, Australia," by R. W. Hedlund

This report describes and illustrates the development of chronostratigraphic correlations of Paleogene sections in eight wells from the Bass Basin and one well each in the Gippsland and Otway Basins of southeastern Australia using graphic correlation - Composite Standard methodology. Palynologic data for this project were generated by Roger Morgan for Amoco Australia Petroleum Company. As a result of this study, stratigraphic range information on high latitude southern hemisphere Paleogene palynomorphs is now included in the Corporate Composite Standard.

The results of this project will serve as a basis for incorporating additional data from southern hemisphere Paleogene sections into this chronostratigraphic correlation network.

SUMMARY

Chronostratigraphic correlations of Paleogene sections in eight wells from the Bass Basin of southeastern Australia have been completed using graphic correlation-Composite Standard methodology. Data for this project were generated by Roger Morgan for Amoco Australia Petroleum Company. The top of the Lygistepollenites balmei zone is shown to be a consistent time equivalent in all wells. Other zonal interpretations by Morgan are diachronous. Differences in relative rates of rock accumulation are shown by the spacing of CSTE units and by the slopes of the Lines of Correlation. As a result of this study, stratigraphic information on the ranges of high latitude southern hemisphere Paleogene palynomorphs have been incorporated in the Corporate Composite Standard.

CONCLUSIONS

1. Palynologic data extracted from range charts generated by Roger Morgan were used for the graphic correlation-Composite Standard technique and have enabled chronostratigraphic correlations in the Paleogene among eight wells in the Bass Basin.

2. The top of the Lygistepollenites balmei zone appears to be the only consistently time-equivalent point in all studied wells.

3. Other interpreted zonal boundaries are shown to be diachronous.

4. Differences in the relative rates of rock accumulation have been shown among the wells.

5. No faults or unconformities were detected in any of the eight Bass Basin wells.

6. Stratigraphic range information on high latitude southern hemisphere Paleogene palynomorphs is now included in the Corporate Composite Standard, providing an internally consistent time framework for future biostratigraphic applications.

RECOMMENDATION

The results from this project should be utilized as a basis for incorporating additional data from southern hemisphere Paleogene sections into this chronostratigraphic correlation network.

INTRODUCTION

This project was undertaken in an attempt to refine subsurface correlations in the Paleogene section of the Bass Basin, offshore southeastern Australia. The study includes rocks of Eocene and Paleocene age assigned to the Demon's Bluff Formation and the upper half of the Eastern View Coal

Proprietary - for the exclusive use of Amoco Production Company and other wholly owned subsidiaries of Amoco Corporation.

Measures in eight Bass Basin wells. All data were generated by Roger Morgan for Amoco Australia Petroleum Company (see References).

Data generated from this project have resulted in chronostratigraphic correlations among eight wells in the Bass Basin and one well each in the Gippsland and Otway Basins using graphic correlation methodology and resultant Composite Standard Time Equivalents (CSTE). Graphic correlations were effected by comparison with the Cenozoic Composite Standard, thus adding high latitude southern hemisphere palynologic data to the corporate database.

PROCEDURE

Consultant's data from wells in the Bass, Gippsland and Otway Basin were provided by the ELAFE Region. Locations of wells in the Bass Basin are illustrated in Figure 1. Only raw data from checklists and uninterpreted range charts were used for correlations. Data from the following wells proved to be adequate for graphic correlation:

Bass Basin

Locality 14406. Amoco Koorkah No. 1
(API 970330379300)

Locality 14443. Hematite Petroleum Aroo No. 1
(API 970330159400)

Locality 14451. Amoco Yolla No. 1
(API 970330378900)

Locality 14408. Amoco Tilana No. 1
(API 970330379400)

Locality 14444. Hematite Petroleum Nangkero No. 1
(API 970330138700)

Locality 14445. Esso Pelican No. 1
(API 970330077700)

Locality 14407. Amoco Pelican No. 5
(API 970330458100)

Locality 14409. Amoco Pelican No. 4
(API 970330172100)

Gippsland Basin

Locality 14550. ESSO - BHP Veilfin No. 1
(API 970330297300)

Otway Basin

Locality 14612. Shell Development Co. Voluta No. 1
(API 970330101800)

Of the total number of 192 palynomorph taxa in the consultant's reports, 64 had been documented previously in the Amoco Paleo File (Appendix I). An additional 102 pollen and spore taxa were documented from the literature and assigned Amoco unique numbers (41000 series) for computer applications (Appendix II, unique numbers 41026 to 41128).

Because of the provinciality of the southern hemisphere spore/pollen flora and because no high latitude southern hemisphere data were present in the corporate standard, a local Bass Basin Composite Standard was first constructed. Subsequently, data from the ESSO-BHP Veilfin No. 1 well in the Gippsland Basin were acquired. These data included both the Bass Basin flora and marine planktonic taxa already included in the Tulsa Research database, allowing correlations to the Cenozoic Composite Standard. All Bass Basin wells were then correlated through the Veilfin well to the corporate Cenozoic Standard.

DISCUSSION OF RESULTS

Data from each of the ten wells are presented as graphic correlations in Figures 2 through 11. The x-axis represents the Cenozoic Composite Standard, subdivided into Composite Standard Time Equivalents (CSTE) with their approximate relative age equivalents; the y-axis represents the well being graphed and includes the interval studied in either feet or meters. Each graph includes the highest recorded occurrence of each fossil taxon in the well (+) and the lowest occurrence (o) in either sidewall core or core sample. Bases in cuttings samples were not used. Each graph also illustrates the Line of Correlation (LOC - an average rate of rock accumulation) and the calculated A and B values.

Correlations among the eight Bass Basin wells were made only after the LOC was determined for the Esso-BHP Veilfin No. 1 well (Figure 2) using the Cenozoic Composite Standard Reference Section as the x-axis. The Veilfin No. 1 data included enough data residing in the Tulsa Research database to effect correlations and also included the Bass Basin spore/pollen flora, allowing correlations of the Bass Basin wells to the Cenozoic Composite Standard and providing an internally consistent time framework. The horizontal terrace in the LOC for the Veilfin No. 1 indicates the presence of a major Miocene-Eocene unconformity. Horizontal terraces in all other graphs (Figures 3 through 11) indicate the upper limits of data and not unconformities.

The stratigraphic correlation in Figure 12 (in pocket) includes the eight Bass Basin wells from northwest to southeast, using the top of the Eastern View Coal measures as the datum. This figure is taken from "Stratigraphic

Proprietary - for the exclusive use of Amoco Production Company and other wholly owned subsidiaries of Amoco Corporation.

Cross-Section X-X'" as interpreted by M. Donaldson (March, 1987). It includes no structural data, but shows, by spacing of each tenth CSTE, the differences in average rates of rock accumulation among the wells, based on the LOC from each graph. It should be noted that the closer the spacing of the CSTE's, the slower the relative rate of rock accumulation, suggesting rapid rates in the Pelican area (Localities 14445, 14407, 14409) and the slowest rate in the Nangkero No. 1 well (Locality 14444).

The same phenomenon is apparent in Figure 13, a composite diagram which includes the Lines of Correlation for all Bass Basin wells. Each well exhibits a different relative rate of rock accumulation, as shown by the steepness of the slope of the LOC. A steeper LOC slope represents a more rapid rate as shown by the Pelican wells (Localities 14445, 14407, 14409) and the least steep slopes in the Nangkero No. 1 (Locality 14444) and Aroo No. 1 (Locality 14443) represent the least rapid relative rates.

Figure 14 is a chronostratigraphic correlation chart representing the studied section in the Bass Basin from northwest to southeast. Unlike the cross-section in Fig. 12, the vertical scale is subdivided into equally-spaced CSTE's to illustrate in time-slice fashion the chronostratigraphic units in each well. Confident zonal interpretations by Roger Morgan have been superimposed on the chart. These Paleogene pollen zones are used throughout the Bass Basin and include the following:

Zone	Published Relative Age
Upper Nothofagidites asperus (UNa)	late Eocene-early Oligocene
Middle Nothofagidites asperus (MNa)	middle to late Eocene
Lower Nothofagidites asperus (LNa)	middle Eocene
Proteacidites asperopolus (Pa)	early to middle Eocene
Upper Malvacipollis diversus (UMd)	early Eocene
Middle Malvacipollis diversus (MMd)	early Eocene
Lower Malvacipollis diversus (LMd)	early Eocene
Upper Lygistepollenites balmei (ULb)	Paleocene
Lower Lygistepollenites balmei (ULb)	Paleocene

Figure 14 includes only those zonal interpretations by Morgan which are based on positive evidence in his reports (e.g., highest occurrences; lowest occurrences in core or sidewall core samples). A listing of questionable interpretations based on negative evidence, relative abundance data or bases in cuttings samples for each well is included as Appendix III. The only consistent zonal interpretation in all eight wells is Morgan's top of the Lygistepollenites balmei zone, identified by the same fossils in each well. This point compares closely with CSTE 20830, a time point equivalent to the earliest Eocene in the Cenozoic Composite Standard. Consequently, the taxa identifying the top of this zone

(Lygistepollenites balmei, Gambierina rudata) were used to position the LOC in each well. All other zonal boundary interpretations by Morgan included on Figure 14 show diachroneity among the eight wells (e.g., tops of P. asperopolus, middle N. asperus, middle M. diversus).

As a result of the compositing of data from the wells in this study, stratigraphic range information on high latitude southern hemisphere Paleogene palynomorphs is now included in the Cenozoic Composite Standard. The sequence of occurrences of these taxa is shown in the Composite Standard Range Chart in Figure 15. Numbers on the vertical axis are CSTE units and ranges are plotted based on youngest occurrences. These data will prove to be of value for chronostratigraphic applications in future high latitude southern hemisphere exploration areas.

313366

PART I

LOG ANALYSIS OVERVIEW

Overview

The LOGEVAL program was used to evaluate the twenty-one wells contained in this report.

Multiple logging runs were merged for each well and run specific information such as bit size and mud properties were input to normalize and correct the log data. Independent interval parameters were selected to control the volume of shale porosity and water saturation calculations.

The results of the formation evaluation are tabulated in the Pay Summaries, along with the specific processing parameters used. Two pay Summary Plots and one Reservoir Quality Plot are enclosed to illustrate the results for each well.

The Data Listing contains a detailed report of both measured and computed data through all potential reservoir intervals in each well.

The other plots enclosed provide a graphical representation of the log analysis methods used and the results obtained.

At the end of this section is a more detailed description of LOGEVAL and a glossary of mnemonics and curve names used.
