

#### IV. MAXIRAN CALIBRATION

The Maxiran system was calibrated between 1400 and 1630 hours 1 February 1986, prior to the commencement of the Well Location SEAL #1 survey. For this calibration, the Maxiran mobile equipment was installed at Station Point Lonsdale, and the base station equipment was installed at Station Parkers Hill. The computed slope range of 110.784 kilometers between the two markers was used to calibrate the system.

The following pages consist of field reports of the calibration.
