

A2.5 Palynology/Biostratigraphy

Twelve (12) unwashed cuttings samples and two (2) sidewall cores were forwarded to Roger Morgan for palynological analysis. As can be seen from Figure No. 3 'Predicted vs Actual Stratigraphy' the major difference brought to light by the palynology is the higher than expected tops of the Late Cretaceous and Paleocene.

The following is a summary of the palynology and biostratigraphy of Chat No. 1. The full report from Roger Morgan is included as Appendix 4 in this Well Completion Report.
