

c. Hydrocarbon Indications

Only traces of gas were recorded from 268 to 1300 metres and from 3022 to 3104 metres. In the interval 1300 to 3022 metres a trace to five units total gas was recorded. This was mostly dominantly methane with minor ethane and propane indicating that it was coal gas. At 2450 metres traces of oil were observed with associated gas ranging from methane to butane.

Maximum trip gas throughout the well was nine units. No connection gas or cuttings gas was recorded throughout the well.
