

Middle *Malvacipollis diversus* zone (7075'), confidence of zone assignment poor because of low species diversity, could be older.

Lower *Malvacipollis diversus* zone (7378'-7688'), upper determination good, but lower part (7674'-7688') might be older (Upper *L. balmei* zone).

*Lygistepollenites balmei* zone, undifferentiated, (7980'-9590'), shallower determination firm, deeper determination could be older (*T. longus* zone).

Reworking of older palynomorphs into younger assemblages is uncommon in Dondu-1 with most of the reworked specimens occurring between 7636 and 8240 feet.

Microplankton are poorly represented in this well and were found consistently between 4840 and 5320 feet and sporadically between 7075 and 8240 feet.
