

Plant macrofossil from Aroo-1 Core No. 2,  
9546 feet (K.B.)

Comments by

J.G.G. Douglas

Victorian Mines Department

The leaf fragment is part of a palmate or chordate dicotyledonous angiosperm, possibly comparable with the sub-basaltic floras of the Bogong High Plains in Victoria. A lower Tertiary age and warm, humid palaeoclimate are indicated.
