

Comments

Two velocity surveys were conducted on the Aroo well.

The first survey on March 27th to 9670 feet was prior to running intermediate $9 \frac{5}{8}$ " casing.

The final survey on April 20th was at a total depth of 12,112 feet K.B.

All shots were in open hole, with one exception at 2942 feet where because of hole oversize below the first casing string the geophone was locked inside the $13 \frac{3}{8}$ " casing.
