EARLY CRETACEOUS											
PRE-CRETACEOUS											

COMMENTS: The SWC's are considered to be unreliable below 6800 ft and have not been used to zone the well. The samples between 7320 ft. and 7930 ft. belong to the M. diversus Zone but it is not possible to determine from the cuttings to which subdivision they belong.

- RATINGS:
- 0; SWC or CORE, EXCELLENT CONFIDENCE, assemblage with zone species of spores, pollen and microplankton.
 - 1; SWC or CORE, GOOD CONFIDENCE, assemblage with zone species of spores and pollen or microplankton.
 - 2; SWC or CORE, POOR CONFIDENCE, assemblage with non-diagnostic spores, pollen and/or microplankton.
 - 3; CUTTINGS, FAIR CONFIDENCE, assemblage with zone species of either spore and pollen or microplankton, or both.
 - 4; CUTTINGS, NO CONFIDENCE, assemblage with non-diagnostic spores, pollen and/or microplankton.

NOTE: If a sample cannot be assigned to one particular zone, then no entry should be made. Also, if an entry is given a 3 or 4 confidence rating, an alternate depth with a better confidence rating should be entered, if possible.

DATA RECORDED BY: A.D. Partridge DATE July 1972

DATA REVISED BY: A.D. Partridge DATE March 1973
