

INTRODUCTION

Analyses of Schlumberger wireline logs was carried out after running each of the logging suites numbers 3 (Feb 9-11, 1986) and 4 (March 2-5, 1986). The results are presented herein in two parts; Part 1 covering the interval 2468.5-3615 meters and Part 2 covering the interval 3647-4226 meters. In addition to the Amoco Log Evaluations, Schlumberger Cyberlook Logs (Enclosure 7) were prepared covering the depth intervals 1750-3003.5 meters, 2955-3633 meters and 3647-4248 meters. Both the Amoco Log Evaluations and the Cyberlook logs indicated the presence of probable moveable hydrocarbons at various levels within the interval 2750-4050 meters. Hydrocarbons (see D.S.T. Results Appendix 6) were recovered on test from the intervals 3143-3162 meters and 2786-2790 meters.
