

CORRIGENDUM

A lower interval of volcanics has been recognised between 4020 and 4260 feet. From Fig. 1 it is evident that this "flow" is at the top of Oligocene. The Maude Basalt of Bowler (1963, p. 127) is disconformable upon Oligocene limestone, but the top of this limestone need not necessarily represent the top of the Oligocene. Therefore this lower "flow", could be closer in age to the Maude "flow", than is the interval of volcanics higher in the Bass No. 1 Well (refer p. 6, this report).
