

GWF9107.009-RJS

CONTRIBUTIONS TO KNOWLEDGE/REASONS FOR FAILURE:

Pelican 1 established the presence of excellent quality reservoirs in the upper EVCM, but they were outside closure and water bearing.

In the lower to middle M. diversus zone condensate charged reservoirs were encountered within closure with good porosity. The deliverability characteristics of these reservoirs was not established by testing and the disappointing results from equivalent zones at Pelican 5 are cause for concern.

Maturity and source rock data from Pelican 1 together with the gas-condensate recoveries from FIT's have established the Pelican half graben as a major hydrocarbon source kitchen.
