

From the sparse data (Figures 7.4 and 7.5) it appears that the net to gross sand percentage follows a similar regional pattern to that encountered in Unit 4, with the highest percentage of net sand occurring in the northeast of T/25P and along the south western margin of the Pelican Trough.

Unit 6 has only been partially penetrated in the centre of the Pelican Trough at Pelican 5 where reservoir quality was poor and at Poonboon 1 where only a few meters of section were drilled. Regional variation in the quality of Unit 6 is therefore poorly known.
