

STRUCTURE

Structural closure is based on a broad regional seismic grid with 3-4 km spacing between lines. The Poonboon North structure is an old structure with prominent rollover at the Early Cretaceous. Structural risk is high, but may decrease if additional data is recorded over the lead.

ADDITIONAL WORK REQUIREMENTS

Poonboon North was not addressed in the Rocky Cape Seismic Survey. Reprocessing of existing seismic data over Poonboon North may assist in further defining closure. However there will still remain a need for additional new seismic data over the structure.
