

with 0.16ppm Au in the panned concentrate. Some goldfields showed low gold in the panned concentrates (i.e. A119557 from the Dan Rivulet field and A119488 from the Warrentina field).

Further work is required on this sheet area in the following areas:

- the A119576/A119577 area (Claytons Creek and Evercreech Rivulet) is currently not under mining title. Further sampling in an area of 120 Sq km is required (best under Exploration Licence) to determine the source of the anomalous gold values. Medium priority.
- the A119572 area (headwaters of the South Esk River in the Tombstone area) requires further sampling to explain the anomaly. Part of this area is held by Goldsearch as EL31/88. Preliminary follow-up sampling should be completed prior to application for title. Medium priority.
- the A119536 area (Marton and Swanee Creeks near Mt. Horror) requires further follow-up sampling to determine the source. This area is not under mining title. Medium priority.
- the A119402 area (Tomahawk River headwaters) requires low priority follow-up sampling - probably in conjunction with A119403 anomaly of the Cape Portland sheet. This area is held partially by Placeco as EL27/86.
- the A119542 area (Becketts' Creek) requires low priority follow-up sampling to confirm and/or define the anomaly. This is low cost/low
