From	To	Length Run Core	% Rec.	Sludge Wt.	No.	Assay Value	Summary Geological Log
182'	194'10"						Quartzite: Medium grey, compact but has been highly fractured - fracture surfaces lined with very thin black graphitic slate. - permeated with random quartz stringers and pods which in turn cut across randomly orientated carbonate stringers (Siderite) Very minor disseminated pyrite associated with quartz/carbonate veining.
194'10"	197'7"						Interbanded, fractured/brecciated quartzite and intensely sheared graphitic black slate, minor random quartz/carbonate veinlets.
197'7"	221'8"						Slate; Black, graphitic, laminated and occasional thin bands of grey quartzite. Whole section highly sheared and disrupted appearance, i.e. laminations/quartzite bands highly contorted/broken and quartzite bands often brecciated and impregnated with pyrite. Fine, randomly orientated carbonate veinlets common throughout section and usually associated with minor
