DIAMOND VENTURES NL

REPORT ON EXPLORATION AT BEACONSFIELD FOR THE PERIOD 8 NOVEMBER 2002 – 31 MARCH 2003

1. INTRODUCTION

This report describes the gold exploration activities undertaken by Diamond Ventures NL (DDV) around the Beaconsfield Gold Mine during the period 8 November 2002 and 31 March 2003.

This exploration activity was undertaken pursuant to an Agreement dated 30 September 2002 between Diamond Ventures NL, the Joint Venturers of the Beaconsfield Gold Mine (BMJV) and the Deed Administrators and Receiver. The Commencement Date of this Agreement is 8 November 2002. This report is submitted in accordance with Clause 19.1 of that Agreement.

The tenements subject of the Agreement are Mining Lease 1669P/M, Mining Lease 6M/2000, Retention Licence 1/1999, Exploration Licence 20/1994 and Exploration Licence 2/2001. During the reporting period exploration was undertaken on all tenements except Mining Lease 6M/2000.

The exploration undertaken during this reporting period comprised an extensive soil geochemical survey, the drilling of sixteen reverse circulation holes for 551m at Salisbury, a stream sediment geochemical survey over EL2/2001, and an attempted (and abandoned) IP survey north of the Beaconsfield Mine. These activities are described below.

2. SOIL GEOCHEMICAL SURVEY

A total of 1464 soil samples was taken at nominal 50m stations along 100m-spaced E-W lines covering the Cabbage Tree thrust slice from the northern property boundary (northern boundary of RL1/1999) to the southern property boundary (southern boundary of EL20/1994). Excised from this survey is an area of 50m x 50m soil geochemical coverage north of Salisbury previously undertaken and recorded by the BMJV. It does however overprint a block of 104 soil samples previously collected by the BMJV on 50m centres in the Salisbury area but never analysed. These were analysed by DDV at the outset. The overprinted survey results confirmed the results from the BMJV sampling.

DDV sampling was conducted by a three-man crew during 26 November 2001 – 5 February 2003. Samples of the B or C soil horizons were taken using a power auger from a nominal depth of 50cm. Sample site coordinates were GPS-located, with an accuracy of approximately ±2m. Samples were forwarded to Analabs in Burnie and analysed for gold, arsenic, copper, lead and zinc.

Results for each element are plotted on the accompanying five summary location plans, and results for gold and arsenic are plotted on three 1:5000 plans. Considering analyses ≥10ppb gold as being anomalous, 55 gold-anomalous sites are identified, with 12 in excess of 100ppb, and a peak value of 7000ppb.

Following completion of this first-pass survey 35 of these 55 geochemically anomalous sites were selected for detailed follow-up, with additional soil samples similarly collected on 25m centres around (and coincident with) each anomalous site. (This selection was generally made on the basis that such follow-up would either downgrade or upgrade the original result, most of the 35 selected sites representing single sample anomalies). For this follow-up survey, which was conducted during 21 February – 17 March, 309 additional samples were collected and analysed for the same five elements. A sample register of this follow-up programme is appended.

As a result of this work fourteen composite gold-anomalous zones have been established as drill targets. These zones are shown on the accompanying summary plan. Shallow (20-30m) open hole percussion drilling is now in order to trace each of these soil anomalies to bedrock source. Some further soil geochemical detailing is required on two target areas (Leonards, and Blue Tier-Ironstone Blow-Drop Creek) prior to drilling.

3. REVERSE CIRCULATON DRILLING

Sixteen shallow vertical reverse circulation drill holes for a total of 551m were drilled at, and south of, the Salisbury workings. These holes were sited to test the resource potential around the old workings, to assist in understanding the disposition of the indicated mineralisation, and to test for gold mineralisation within the E-W Johnsons Creek Fault, as interpreted. Details of these holes are tabulated below. The drilling contractor was Stacpoole Enterprises.

At the Salisbury workings drilling has identified a sub-horizontal sheet of weak mineralisation (in the order of 0.25g/t) about 2-5m thick, over 200m long (N-S) and extending at least 50m eastwards from the western bounding faulted contact of the host Cabbage Tree sandstones with the shales of the Blyth's Creek Formation. Best assays are 1m @ 4.1g/t Au from 35m in hole BRC6 drilled near the recorded position of the historic "nugget chamber", and 2m @ 2.18g/t Au from 10m in hole BRC10 drilled in front of the Powerline Adit. The host sandstones are strongly weathered and the disposition of this mineralisation could in part be controlled by weathering. Surprisingly there is an inverse relationship between grade and vein quartz content, with mineralisation associated with non-veined sandstones. This is contrary to observations in the Powerline adit. The mineralisation is open to the north and east.

Of most interest however are results from BRC14 and 16, two of six holes drilled south of the Salisbury workings, which intersected strongly pyritic, quartz/carbonate veined, graphitic black shales carrying anomalous gold (up to 2m @ 0.67g/t). These rocks are assumed to be part of the interpreted Johnson's Creek fault. Holes drilled south of these two holes (BRV11, 12, 13, 15) are virtually barren such that the Johnson's Creek fault truncates or offsets the mineralisation intersected further north. The geological interpretation of this locale is shown on the attached summary plan. Drill logs are appended.

To test the Johnson's Creek fault for Tasmania Reef style mineralisation two –45° diamond holes are proposed to be drilled to cross-cut the postulated position of the fault. These proposed holes are sited at 5433265N, 486810E and 5433265N, 486730E, the location of the second hole subject to results from the first.

					Best Assays (≥0.10g/t Au over 1m)

4. STREAM SEDIMENT GEOCHEMICAL SURVEY

A total of 172 stream sediment samples was collected throughout Exploration Licence 2/2001 during 18 March – 2 April. This Exploration Licence covers the Anderson Creek Ultramafic Complex and adjacent sediments west of Beaconsfield. It comprises 55km^2 but tenure to the central 32km^2 is held only in respect of >50m depth, the top 50m being held by Jervois Mining with interest relating to lateritic nickel. Access to portions of the central 32km^2 is also restricted on grounds of environmental sensitivity. The stream sediment geochemical survey was nevertheless extended throughout the whole of the Licence, with the exception of the environmentally quarantined areas, such that sample density is approximately 3.7samples per km^2, which is effectively saturation. The survey is now completed, though analyses for only the first 93 samples have been returned at time of writing. No strongly anomalous results are evident in the analyses received so far.

The survey was prefaced by orientation sampling in three streams near Beaconsfield draining known mineralisation - Pease Creek, Brandy Creek and Eaglehawk Bully. Five samples were taken at approximately 100m intervals downstream from known or suspected mineralised sites analysed for gold using BLEG, panned concentrate, -80 mesh and –200 mesh methods/fractions. Results are shown in the appended table. The –200 mesh and –80 mesh analyses provided the most credible results. Given the practical difficulty in obtaining sufficient –200 mesh sample material in the Anderson Creek area, the –80 mesh fraction was eventually used (fire assay on 50g charge) for the survey. In addition analyses for arsenic, copper, lead, zinc and nickel are also being undertaken.

A plan showing the locations of the sample sites, and gold and arsenic analyses received to date, is appended.

5. GEOPHYSICS

A trial gradient array IP survey along a single N-S line traversing soil anomalies and old workings from Pease Creek and North Tasmania to the Beaconsfield Mine Buffer Zone was attempted to determine whether the known mineralisation generated a chargeability response. The trial was unsuccessful owing to unexpected extremely high level interference by electrical or EM noise, presumably from the mining and/or milling operations.

6. EXPENDITURE

Exploration expenditure incurred since commencement of the Agreement is as follows:

	$
Geology	17,796
Geophysics	10,876
Geochemistry	84,553
Drilling	64,267
Tenement	8,766
Sub total	186,258
10% Overhead	18,626
Total	**204,884**

7. FORECAST ACTIVITIES AND EXPENDITURE FOR NEXT QUARTER

(a) Soil geochemical detailing.

While most of the anticipated soil geochemical infill work on the initial 100m x 50m survey has been completed two areas remain for follow-up. These are the Leonards area (west of Little Wonder pond on 1669P/M) and the Blue Tier-Ironstone Blow-Drop Creek area (on EL20/1994. Prospecting, mapping and rock chip sampling would be undertaken (as usual) during this follow-up soil geochemical work.

Depending on results from the stream sediment survey on EL2/2001, soil geochemical follow-up and mapping/prospecting would be undertaken to investigate any anomalies arising from the stream sediment work.

(b) Diamond Drilling

Two 100m holes are planned to test the Johnson's Creek fault, and are expected to be completed in April. Details are listed above. A third hole is planned to test the Moonlight workings – sited at 5438990N, 483595E bearing 045^{o} at –45^{o} for 70m depth. This hole will be drilled at a later date.

(c) Open-hole Percussion Drilling

Drill testing of the fourteen anomalous gold-in-soil target areas will commence. This will be relatively shallow (20-30m) but close-spaced drilling designed to source the soil anomalies to bedrock. Arrangements with two local contractors have been made to trial differing drill methods/set-ups. Reverse circulation drilling would then be undertaken (in a later quarter) to follow up positive results from this percussion drilling.

(d) Forecast Expenditure

Exploration expenditure to undertake these activities during the next quarter is anticipated to be about $90,000.

8. PRELIMINARY FEASIBILITY STUDIES

No Preliminary Feasibility Studies were undertaken during the previous period, no Preliminary Feasibility Studies are expected to be undertaken during the next quarter, and no Expenditure Claims are expected to be made to the Joint Venturers during the next quarter.

W Bucknell.

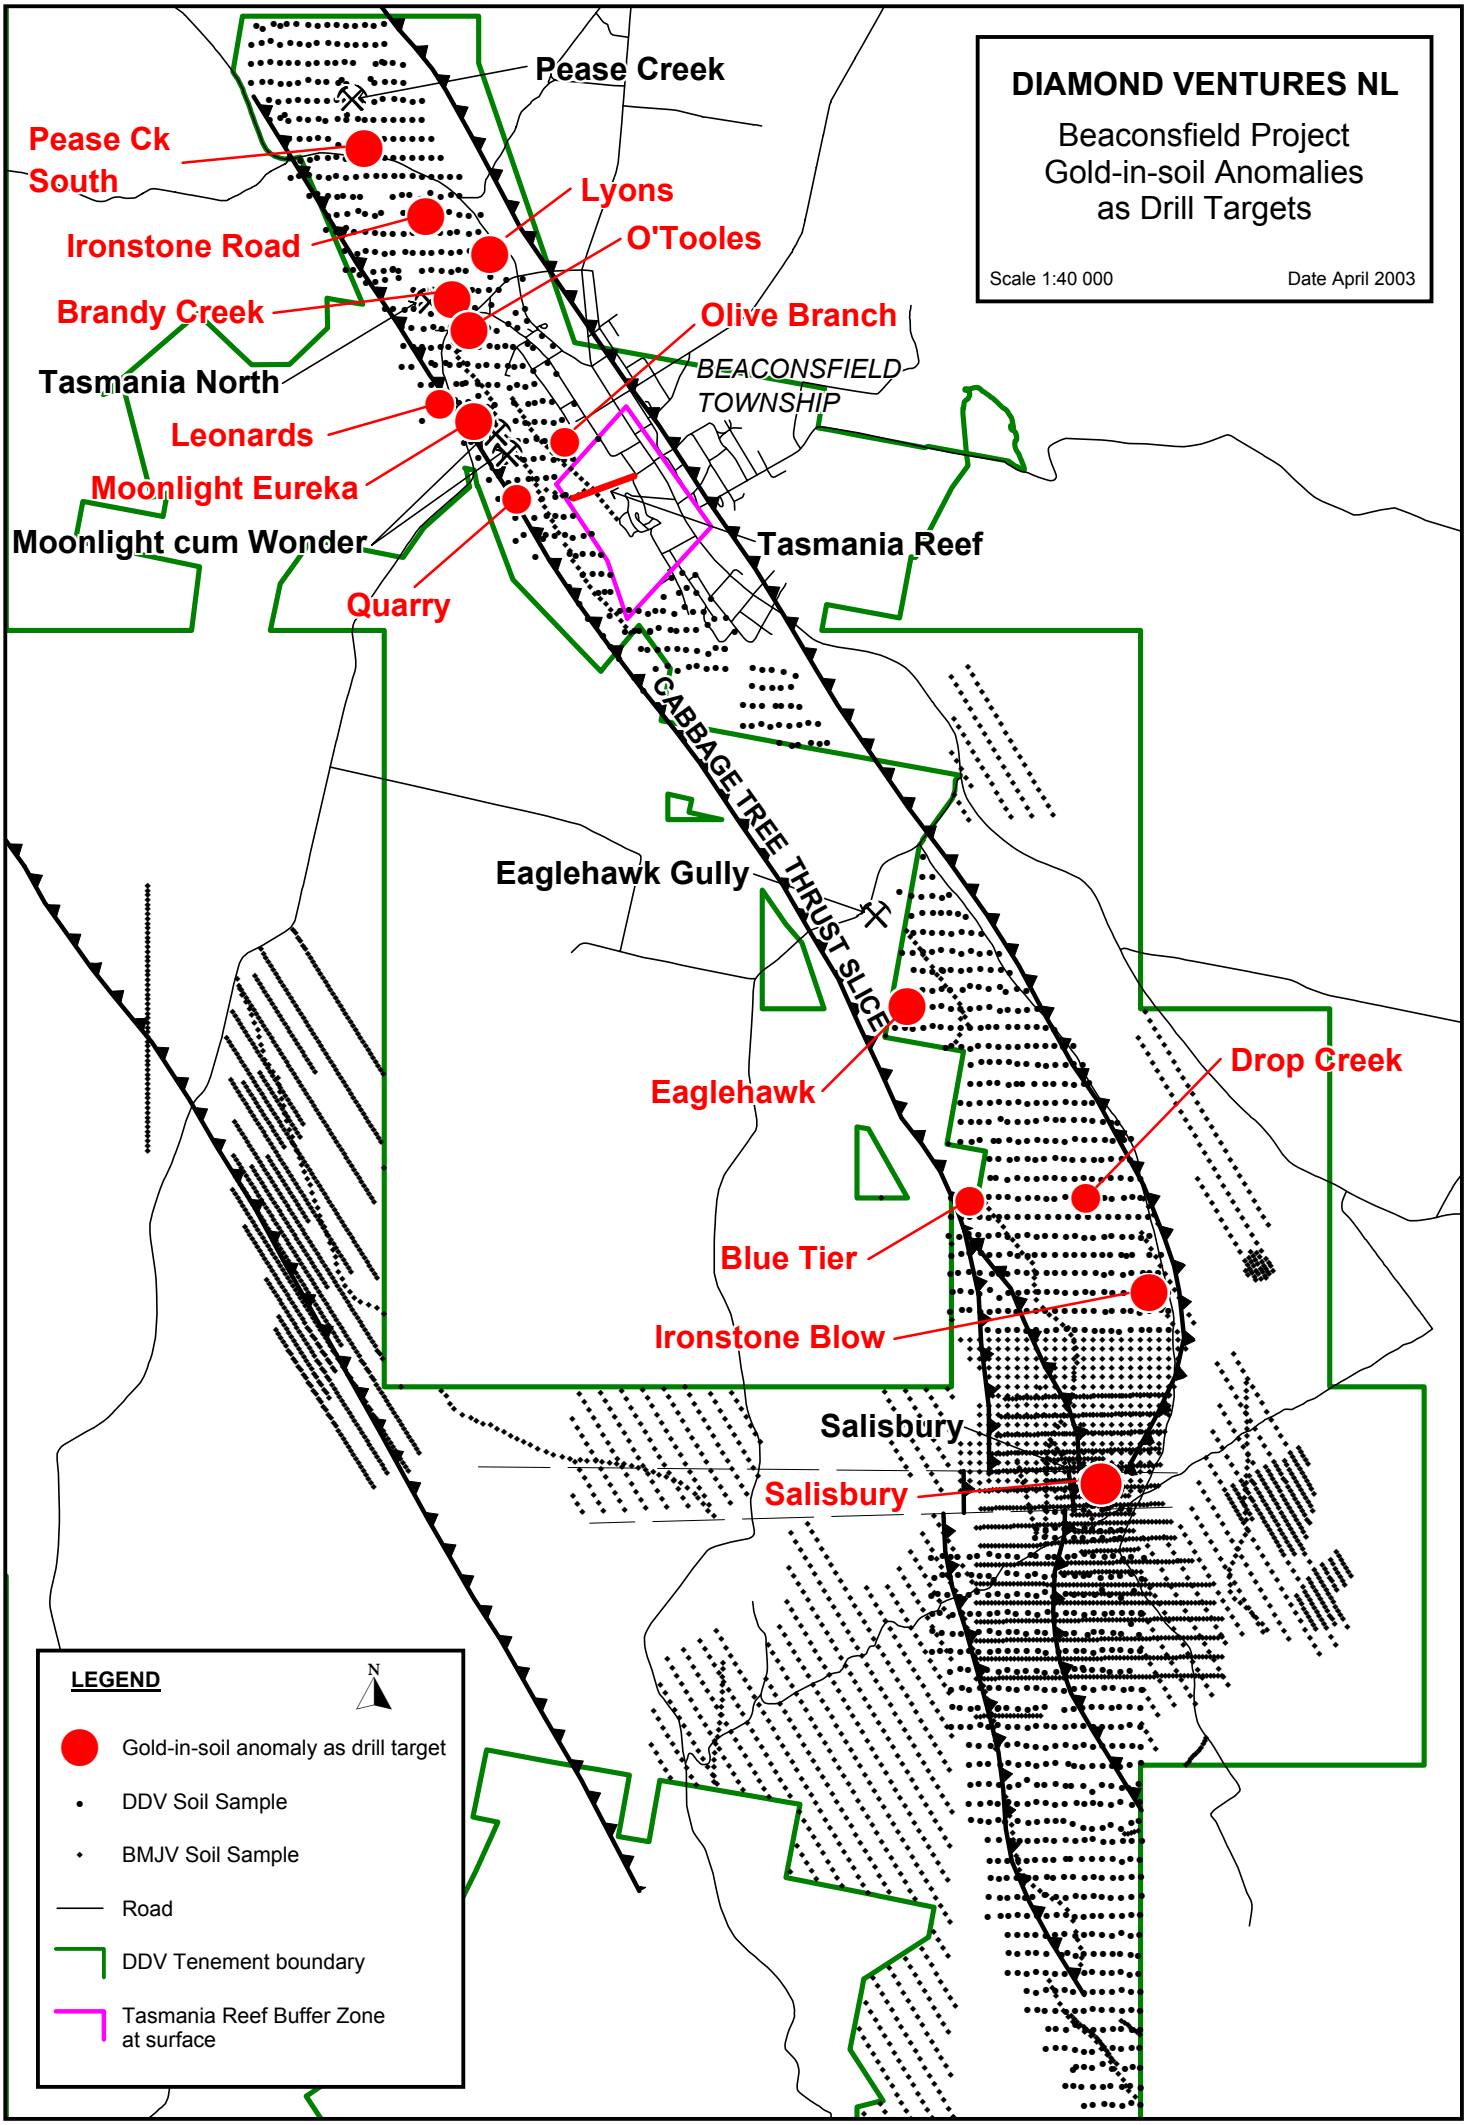
APPENDIX D

Gold-in-Soil Anomalies as Drill Targets

Plan at Scale 1: 40,000



DIAMOND VENTURES NL
Beaconsfield Project
Gold-in-soil Anomalies
as Drill Targets
Scale 1:40 000
Date April 2003
Pease Creek
Pease Ck South
Lyons
Ironstone Road
O'Tooles
Brandy Creek
Olive Branch
Tasmania North
BEACONSFIELD TOWNSHIP
Leonards
Moonlight Eureka
Moonlight cum Wonder
Tasmania Reef
Quarry
CABBAGE TREE THRUST SLICE
Eaglehawk Gully
Eaglehawk
Drop Creek
Blue Tier
Ironstone Blow
Salisbury
Salisbury
LEGEND
N
Gold-in-soil anomaly as drill target
DDV Soil Sample
BMJV Soil Sample
Road
DDV Tenement boundary
Tasmania Reef Buffer Zone at surface
