PLAN

SECTION

Gabbro

- 1 Hydrothermal argillic alteration. Beds variably bleached, clayey. Pyritic down to 134.8m.
- 2 Tuffaceous sandstones with wide units of cheesy siltstones. Some black shale partings.
- 3 Predominantly greenish grey (if not bleached) tuffaceous sandstones, with siltstone tops (graded, grades downhole).
- 4 Predominantly dark grey, black carbonaceous pyritic shales, with interbedded, lighter grey siltstones, tuffaceous sandstones. Some beds calcareous (cal pellets) from 220.3m.
- 5 Dark green foliated/banded altered siltstones (calc pellets?). Differ from calc pellets to south. Extensively altered. Alteration sharp at boundaries. Consist of calcic tremolite, chlorite, epidote, phlogopite, siderite assemblage facies.
- 6 Bleached tuffaceous sandstones, siltstones. Minor shales. Minor pyrite. (resembles? hydrothermally altered beds at top of hole)
