H1000	Hole	From	To	Quartz	Scheelite	Sericite	Serpentine	Siderite	Tourmaline	Vesuvianite	Borate	Texture	Description
H1001		metres	metres	%	%	%	%	%	%	%	%		
D	GWLV1A	0	1										Pad fill + organics intermixed w/ tillite → qzSS. Tertiary cover
D	GWLV1A	1	2										As above
D	GWLV1A	2	3										pad fill and organic material. qzSS
D	GWLV1A	3	4										cobbles (rounded). Oonah Fm. Quartzite. Alluvial gravels.
D	GWLV1A	4	5										As above
D	GWLV1A	5	6										sr-altered SDOL that has altered to RCLY. Silty. (originally srZXS?)
D	GWLV1A	6	7										sr-alt. As above
D	GWLV1A	7	8									rcz	minor silicification. HCl+ when powdered/scratched.
D	GWLV1A	8	9									rcz	minor sr alteration. HCl+ when powdered.
D	GWLV1A	9	10									rcz	sr-alteration. Sr-altered RCLY.
D	GWLV1A	10	11									rcz	As above
D	GWLV1A	11	12									rcz	minor sr-alt. SDOL that has weathered to sand as well as chips.
D	GWLV1A	12	13										Dolomitic sand
D	GWLV1A	13	14									flk	ph-alt + sr-alt. Gn-gy RCLY. Flakey ph. Plus sr-altered SDOL chips.
D	GWLV1A	14	15										Gn-gy sr-altered RCLY w/ chips of silicified material. Silicification - extensive qz veining and alteration.
D	GWLV1A	15	16									rcz	SDOL that has been brecciated + altered by silicifaction.
D	GWLV1A	16	17									rcz	Mostly SDOL fragments. HCl+ when powdered.
D	GWLV1A	17	18									rcz	Mostly dolomitic sand w/ SDOL fragments. Minor sr-alt.
D	GWLV1A	18	19									rcz	SDOL fragments and minor dolomitic sand. Very minor qz + sr alt.
D	GWLV1A	19	20									rcz	SDOL w/ minor tu-alt.
D	GWLV1A	20	21									rcz	weakly weathered SDOL. HCl+
D	GWLV1A	21	22									rcz	ww SDOL
D	GWLV1A	22	23									rcz	ww SDOL
D	GWLV1A	23	24									rcz	Mostly SDOL w/ minor bits of sr-alt RCLY (originally srZXS?)
D	GWLV1B	0	1										qzSS and organics
D	GWLV1B	1	2										qzSS and pad fill
D	GWLV1B	2	3										qzSS and tillite + glacial debris. Larger fragments and more rounded.
D	GWLV1B	3	4										SVGL held in waterlogged cy matrix. qzSS fragments are smaller than previous.
D	GWLV1B	4	5										SVGL in RCLY matrix w/ sr-altered cy. FG fragments. Cl alteration. Trouble w/ water return.
D	GWLV1B	5	6										RCLY w/ sr-alt. Minor large fragments of qzSS.
D	GWLV1B	6	7									rcz	SDOL fragments w/ some sr-alt cy.
D	GWLV1B	7	8									rcz	SDOL fragments of varying sizes (up to 10cm) held in RCLY. Sr-alt.
D	GWLV1B	8	9									rcz	Predominantly SDOL fragments w/ very weak sr-alt. Minor clumps of RCLY.
D	GWLV1B	9	10									rcz	SDOL w/ trace sr-veining. Flow test - 1L/sec
D	GWLV1B	10	11									rcz	SDOL w/ sr-alt + veining. Minor tu-alt.
D	GWLV1B	11	12									rcz	As above. Flow test - 2L/sec
D	GWLV1B	12	13									rcz	SDOL w/ sr + tu alt + veining. Very slight pink tinge - ax alt?
D	GWLV2	0	1	0	0	0	0	0	0	0	0	plt	Mod sorted dbn gravelly sand. smg sand w/ mnr gravel-sized fragments micaceous fg ss. Rare cobble-sized fragments sfg mi ss

D	GWLV2	34	35	0.05	0	0	0	0	0.05	0	0		Sfg qz rich ss. Rare qz-tu veins.
D	GWLV2	35	36	2	0	0	0	0	3	0	0		Sfg qz rich ss. Common qz-tu veins. Rare sfg py rich clasts.
D	GWLV3	0	1										gy SS. Logged from chip trays
D	GWLV3	1	2										gy qzSS fragments (up to 5mm). Relict qz and SS grains in SGVL.
D	GWLV3	2	3										Mostly fine SGVL w/ qz, SS + fsp (?) fragments.
D	GWLV3	3	4										Gravel made up predominantly of qz grains. Minor tu-alt.
D	GWLV3	4	5										qz fragments held in cy matrix. Fsp fragments (?). Logged from chip piles. Gy cy.
D	GWLV3	5	6										As above.
D	GWLV3	6	7										As above
D	GWLV3	7	8										As above.
D	GWLV3	8	9									stk	Less qz - more cy. Qz + fsp (?) fragments in bn-cy matrix. Some bn cy has streaks of gy througout.
D	GWLV3	9	10									stk	As above. Less streaky gy-cy than above. Fsp fragments (?)
D	GWLV3	10	11										lithic fragments (qz + fsp) held in bn-cy matrix.
D	GWLV3	11	12										sr-rich clay w/ large fragments of broken qz-alt. Silicified via XHB?
D	GWLV3	12	13										As above.
D	GWLV3	13	14										sr-rich RCLY. Large proportion of qz fragments: some looks like silicification (XHB?) and some looks like SS fragments.
D	GWLV3	14	15										Mostly qz fragments from quartzite. Sugary texture. Very minor sr-altered RCLY. Orange fe staining.
D	GWLV3	15	16										As above but no RCLY. Sugary texture. Fe-staining.
D	GWLV3	16	17										As above
D	GWLV3	17	18										As above
D	GWLV3	18	19										as above. Very minor fragments of metallic-looking RGOs-type material. No magnetic material.
D	GWLV3	19	20										As above, but slightly more RGOS material. Increased og colour.
D	GWLV3	20	21										very minor magnetic material, but mostly qz fragments. Strong og-bn colour.
D	GWLV3	21	22										RGOS and qzSS fragments in an RCLY matrix
D	GWLV3	22	23										As above. Not very much RGOS material. Strong og-bn colour.
D	GWLV3	23	24										qzSS fragments in RCLY matrix. Not much RGOS material. Og-bn colour.
D	GWLV3	24	25										qzSS fragments and some metallic-RGOS fragments. Minor magnetic fragments.
D	GWLV3	25	26										qzSS fragments and metallic RGOS material. Sugary texture
D	GWLV3	26	27										As above.
D	GWLV3	27	28										sugary qzSS. Trace RGOS fragments.
D	GWLV3	28	29										As above
D	GWLV3	29	30										as above. No RGOS present
D	GWLV3	30	31										As above
D	GWLV3	31	32										as above
D	GWLV3	32	33										As above
D	GWLV3	33	34										As above
D	GWLV3	34	35										As above
D	GWLV3	35	36										As above. Mostly fine-grained gravel - around 10mm in size
D	GWLV3	36	37										As above
D	GWLV3	37	38										As above
D	GWLV3	38	39										As above. Mix of coarse and fine fragments

D	LV035M	57	69	1	0	0	60	0	0	0	0	hbr	mw interval of ZMRB that has been heavily altered by sr, forming srZXS in places. Interval is relatively competent w/ only minor cy formation. Sr formation on broken surfaces. 10cm thick qz vein at 62.9m. Minor sections of interval appear to have a ctc, b
D	LV035M	69	70.8	0	0	0	20	0	0	0	0	stk	interval of vw doMRZB that has altered to a wt sfg (originally do?) sand. Extensive dgn sr alteration in middle of interval. Minor dgn stk sr veins through wt sand.
D	LV035M	70.8	75.4	0	0	0	40	0	0	0	0	stk	vw interval of dgn RCLY. Dgn cy has a waxy feel - probably sr. stk bn throughout patches of the interval. Towards EOI interval becomes quite moist and gritty, containing various sizes of lithic fragments.
D	LV035M	75.4	77.5	0	0	0	5	0	0	0	0	stk	vw interval of lbn RCLY containing very minor steaks of lgn cy (sr?). Streaks of og-bn and dbn cy throughout.
D	LV035M	77.5	80.5	0	0	0	0	0	0	0	0	stk lam	vw bn RCLY w/ large amounts of bk streaking throughout (manganese oxide?) minor laminations seen within bk cy, picked out by cm cy. Lbn cy streaks throughout interval.
D	LV035M	80.5	97	1	0	0	0	0	0	0	0	dis	vw interval of cyRB containing clasts of SST, RGOS and silicified material within a cy matrix. Large semi-rounded clasts upto 4cm across. Very minor patches of dis mt throughout. Minor ferruginous cy throughout as well as reddish discolouration to some cl
D	LV035M	97	98.7	0	0	0	0	0	0	0	0	dis stk	vw interval of lbn RCLY. Minor patches of dis mt throughout. Parts of the interval are quite sloppy. Streaky dbn cy runs throughout the interval. Minor ferruginous cy formation
D	LV035M	98.7	100.5	0	0	0	0	0	0	0	0	dis stk	interval is very sloppy in places, but mostly rubbley cy. Vw bn RCLY, w/ significant section of dbn-bk cy that has widespread dis mt. streaks of lbn through dbn cy. Very minor ferruginous cy.
D	LV035M	100.5	102.5	20	0	0	0	0	0	0	0	dis	RCLY w/ several zones containing ka and img qz grains - originally FG? Relict FG zones are interspersed between RCLY zones - suggesting FG dykelets? Inbetween relict FG zones cy is dbn w/ dis mt.
D	LV035M	102.5	105	0	0	0	0	0	0	0	0	dis stk	interval predominantly of bn-dbn SAND containing dis mt. remainder of interval is bn RCLY w/ dbn-bk streaks through. Dbn-bk streaks are magnetic. Very minor fe oxide staining to some patches of cy. Parts of interval are quite sloppy.
D	LV035M	105	108.9	0	0	0	0	0	0	0	0	dis stk	vw RCLY w/ minor mt zones. Interval becomes very sloppy towards EOI. Streaks of pk-bn cy near SOI.
D	LV035M	108.9	127.7	0	0	0	0	0	0	0	0	dis aci	interval predominantly consisting of RGOS w/ minor zones of RCLY throughout. img relict aci needles of vo that have altered to mt and then to he. Minor mt throughout interval, of varying strengths. Patchy go throughout also. minor re-drilled fragments.
D	LV035M	127.7	133.1	0	0	0	0	0	0	0	0	dis flk	interval of mw RGOS (non-aci) that gradually becomes a mica-rich RCLY. Minor mt throughout RGOS and minor patches in RCLY. RCLY has extensive flakey ph and mu alteration. He alteration of mt.
D	LV035M	133.1	134.8	0	0	0	0	0	0	0	0	flk stk	vw interval of RCLY. Extensive wt ka formation throughout interval - suggests fsp rich protolith. Lgn cy - montmorillonite? Minor flakey ph towards EOI. At SOI, minor streaks of bn clay through wt ka.
D	LV035M	134.8	138	0	0	0	0	0	0	0	0	aci flk mta	vw RCLY w/ some minor sections of aciRGOS. Aci vo altered to mt, which in places has altered to he. Minor pl cy at SOI - manganese oxide? Dense flakey ph alteration towards EOI.
D	LV035M	138	154.3	0	0	0	0	0	0	0	0	bot aci mta	mw to vw interval of a mixture of RCLY and aciRGOS. Siginificant sections of competent aciRGOS that becomes rubbley and then altered to cy. Minor section of botryoidal mt. icg relict vo needles - up to 15mm. Significant he staining of cy. Minor go.
D	LV035M	154.3	166.7	0	0	0	0	0	0	0	0	bot aci mta flk	competent aciRGOS w/ very minor rubbley sections. Several occurences of bot mt. icg relict aci vo needles that have altered to mt and then to he. Extensive core loss towards EOI. Minor go. Minor zone of ph alteration towards EOI.
D	LV035M	166.7	170.1	0	0	0	0	0	0	0	0	aci mta flk	vw interval of RCLY that was originally mtZXS/RGOS. Icg relict aci vo needles that have altered to mt. minor he staining of cy. Interval consists of broken, rubbley RGOS and mtZXS that is altering to cy. Very minor flakey ph at SOI.
D	LV035M	170.1	179.2	0	0	0	5	0	0	0	0	aci mta mas bxw	competent, mas mtZXS that has weathered to magnetic RCLY in a few places. Minor boxwork texture in places. icg relict aci vo needles that have altered to mt. very minor alteration of mt to he. Minor patches of wt-lgn sr. minor sr veining.
D	LV035M	179.2	190.7	0.1	0	0	10	0	0	0	0	aci mas mta bxw dis bnd	mas and aci mtZXS. Very coarse grained (ipg) relict vo needles - up to 50mm long. Several minor patches of mt altered to he forming RGOS. Significant patches of interstitial sr throughout interval, sometimes in weakly defined bands. Single vein of fl-sr a
D	LV035M	190.7	193.6	0.1	0	0	40	0	0	3	0	mtg gtp blb	mixture of mtZXS and srZXS. Mt is present in blobs throughout interval. Significant sections of interstitial sr in mtZXS, as well as several zones of dense srZXS. At EOI very minor zone of gtveZXS potentially overprinting srZXS (?). Minor qz and cc veinin
D	LV035M	193.6	209	0	0	0.1	0	0	0.5	0	0	euh dis	interval of FG w/ minor tu-alteration at SOI. Very minor se alteration of fsp throughout. Interval is moderately fractured at SOI before becoming slightly more competent. Euh icg fsp and qz. Very minor dis py on some broken surfaces.
D	LV036	0	3	0	0	0	0	0	0	0	0		a few large fragments of qzSS & ZQT
D	LV036	3	12.1	0	0	0	0	0	0	0	0	grn mot	severely cy-weathered img-icg FG w/ relict qz grains & trace fp. Mot cm or gn in places where fp first altered to se before cy?
D	LV036	12.1	14	0	0	0	0	0	0	0	0		handful of qzSS & ZQT cobbles; hole contamination
D	LV036	14	20.8	0	0	0	0	0	0	0	0	grn mot	partially washed out & lithic fragment contaminated cy-alt FG
D	LV036	20.8	22.8	0	0	0	0	0	0	0	0		qzSS cobbles and odd chunks of cy-alt FG
D	LV036	22.8	25	0	0	0	0	0	0	0	0	grn mot	mostly washed out qz gravel after FG w/ relict chunks & zone of coherent cy-alt FG. Slightly fresher than further up hole
D	LV036	25	26.5	0	0	0	0	0	0	0	0		
D	LV036	26.5	33.1	0	0	0	0	0	0	0	0	grn mot hrn	cy-alt FG w/ lower qz grain density than previous FG intervals. Zones of mot cm-gy-dgy cy/RCLY w/ dgy streaks forming a pattern similar to coarse hrn.
D	LV036	33.1	44.4	0	0	0	0	0	0	0	0	grn	cy-alt FG, much like previous intervals, without RCLY zones. Subtle changes in cy-colour dh.
D	LV036	44.4	46.1	0	0	0	0	0	30	0	0	grn	short fr ZQT fragments & short sections of granitic cy w/ tu streaks. qzSS fragment contamination
D	LV036	46.1	47	0	0	0	0	0	0	0	0	mot	weakly contaminated RCLY interval w/ distinctive colouring & significant grn silvery gy-rd he; trace grains very ealy magnetic. Trace img ph & significant dis ivfg mi.
D	LV036	47	73.4	0	0	0	0	0	0	0	0		well frc fragments of gy sandy rock, some w/ gn-ish tinge; HCL-, but some fragments pitted & have pk-rd mot. Mixed qzSS & doZMRB fragments? Lesser coherent sections of cy-hosted fragments (cyRB) & mod. Coherent sandy silt.
D	LV036	73.4	87.5	0	0	0	0	0	0	0	0	mot	monomict breccia. Ang-subrounded ferrous stained qzSS (5mm-120mm) clasts w/ minor variable clay weathered qzSS. qzSS-has abundant qz veins and some fragments are silicified. Within a sandy cm clay matrix.
D	LV036	87.5	91.5	0	0	0	0	0	0	0	0	mot mtg	matrix supported pollymict breccia. Og ferrous clay w/ ang to sub rounded clasts of qzSS, RGOS (1%), and wt cy clasts. Rare wt vitreous aci- translucent brittle min does not react with hcl. Minor weathered mtg in matrix. ?sr in matrix at 91.1.
D	LV036	91.5	98.4	0	0	0	0	0	0	0	0	mot	poorly recovered rubble w/ cm cy matrix supported horzions. Clasts are composed of qzSS- abundant qz veins some partially silicified fragments. Vuggy-voids have a botroyidal siliceous coating. 0.6m core loss @ EOI
D	LV036	98.4	108.3	0	0	0	5	0	0	0	0		poorly recovered mixed RCLY-cyRB polymict breccia w/ qzSS fragments, sandy sections & bands of conc. Sr-alt lithics
D	LV036	108.3	120.2	5	0	0	1	0	0	0	0		poorly recovered mixed fragments of qzSS & siicified ZMRB, some w/ relict ifg ph. Minor sections of cy w/ sr streaks.
D	LV036	120.2	125.6	20	0	0	0	0	0	0	0	mot dis	partially silicified doZMRB fragments
D	LV036	125.6	129.3	50	0	0	2	0	0	0	0		silicified doZMRB fragments w/ washed out relict platy ph→4mm
D	LV036	129.3	136.8	5	0	0	1	0	0	0	0	mot	doZMRB weathering to ifg do-sand. Minor redrilled fragments

D	ML081	11.2	11.9								0	tnb	strongly bt alt SST. lcg bt+cl veins. Very mottled contact with FG partially melted ST-icg bt mineralisation.
D	ML081	11.9	13.3								0	po	img po FG with se and tu alteration.
D	ML081	13.3	21.2								0		interbanded bn-gy btZHF and lesser wt-pk-gn-lgy pxZHF. Within pxZHF are randomly orientated am±po veinlets and rare qz-tu veins. Minor patchy am alt of pxZHF. Cl+py veins throughout.
D	ML081	21.2	25								0		lam-tnb pxZHF, mottled intervals. Mineral zoning mostly follows lam. Abundant anastomosing am-po±cl±apy veinlets often occuring with a gn am alt selvage. Sx's occur in veins and conc in ifg bands and spots . Weakly microfaulted.
D	ML081	25	26								10	pbl	banded am-cc-vo ZXS with a relict pb texture. Am and vs pb in a vo-ca matrix. Vo occurs d/s and conc in bands associated with mt (vo has mt alteration rims). Sx's are d/s and in irregular d/s veinlets.
D	ML081	26	30								1	mot pbl	lam and mot wt-pl-gn-pk pxZHF strong mineral zoning following lamminae. Weakly microfaulted. Am-po irregular veins. Po also is mineralised in rounded conc spots with am and px. gtZXS occurs as patches, minor bands and irregular thick veins, pb gt's with a
D	ML081	30	41.4								10	pbl	banded am-ca-vo-mt ZXS grading in + out of vs-ca-am-px ZXS. Rare patches of relict gtZXS and pxZHF. Strong pb texture throughout- several pb combinations. Vo occurs in the matrix surrounding pb's of vs and am. Vo is occurs with mt alt rims. Mt mostly gran
D	ML081	41.4	44.8								5	pbl	banded pb vs-amZXS with bands and patches of pxZHF (alt rims and veins) and partially pseudomorphed gtZXS. Thin FG dyklets - within the 20cm dyklet and in the vsZXS at 43.5m, are ifg pk gt patches with px rims very similar to those seen in lpZXS.
D	ML081	44.8	49.5								0	ppy	img po fg, gn se alt of fp. Very minor tu alt. tu+cl veins with wt si halos.
D	ML081	49.5	56.7								0	pbl mot	banded pb gtZXS interbanded with lesser pxZHF (increases d'hole). Tnb-lam. From 49.7m there is a 50cm interval of mtZXS (>50% mt) granular mt in the matrix surrounding vs-am and partially replaced gts and ca. Within the gtZXS the gt's can be partially pse
D	ML081	56.7	61.2								0	mot	tnb pxZHF with lesser intervals of btZHF. Mottled wt-pk-gn patches mostly banded and lam (mineral zoning). Irregular am-po veinlets with wt px selvages. Po occurs conc in bands and rounded blobs with am often has a wt px halo. Tu-qz granitic dyklet at 57m
D	ML081	61.2	86.2								0	ppy	img po FG with gn-yw se alt of fp. Minor qz-tu alt. tu-qz veins and rare icg tu-qz-fl-po veins near contact. Bt concentrated bands (30% bt- elsewhere 5%) icg-pegmatic FG veins.
D	ML082	0	39										VOX SSLT and SGWK
D	ML082	39	56.15										Variably fractured and oxidised chloritic SSLT and SGWK with VQCX (po) and quartz-chlorite veins infilling fractures

H1000	Hole	From	To	Quartz	Scheelite	Sericite	Serpentine	Siderite	Tourmaline	Vesuvianite	Borate	Texture	Description
H1001		metres	metres	%	%	%	%	%	%	%	%		
D	ML082	56.15	81.5										Cl-STUF and cl-bt-STUF with VX, VQX and VQL. Cm to gn coloured cl-STUF is predominant between 56.2 - 64.8m and between 64.8 - 81.6m gn-bn coloured cl-bt STUF is predominant. The cl-bt STUF has distinctive whispy texture produced by extensive cl veining. T
D	ML082	81.5	98										sfg SGWK and SSLT. The SSLT is a resinous bn colour, possibly froas VQL from 1mm to 4cmm secondary bt. This unit also has a soft powdery mineral, that appears to disolve in HCL and coats fracture surfaces - stilbite?
D	ML082	98	102.1										Cl-bt STUF with VQ, VX, VQX, VQL. This is a resinous brown coloured skarn with dark green cl associated with veining.
D	ML082	102.1	129										Dark grey SSLT with VQX and VQX (po, stilbite and epidote group minerals). The vein textures are network transitional to breccia.
D	ML082	129	156.3										Dark grey SSLT with quartz +/- stilbite +/- epidote +/- pyrrhotite. The network veins of quartz and chlorite become dominant down hole. At 134m beds show grading down hole and at 141.7m there is a minor fault breccia with a matrix of stilbite, calcite an
D	ML082	156.3	157										SGWK groundmass with SSLT clasts. The clasts are sub-angular and vary in size from 2mm-1cm. Clasts maybe rip-up clasts.
D	ML082	157	187.6										Silicified dark grey SSLT and SGWK with minor alteration mineralisation. At 159.3m there is possible loading indication younging down hole but, these could also be minor fracture disturbances. At 161.8m there are two beds that are fining up hole.
D	ML082	187.6	201										Green chloritic STUF with quartz + phyrrotite +/- epidote. There are veins up to 15cm thick with some brecciation.
D	ML082	201	214										This unit consists of a dark grey STUF with VQLX and VX that transitions to a very fine grained silicious meta-sediment. The pyrrhotite occurs as veins but also replaces the primary lithology with cauliform textures developed
D	ML082	214	216.6										Brecciated and re-cemented STUF and SSLT. The matrix consists of quartz, chlorite and clacite. There are veins and blebs of sulphides and some micro-folding.
D	ML082	216.6	291.9										This unit is STUF with bands of chlorite, biotite and pyrrhotite possibably following former bedding planes. There are thick (5cm), but rare VLQCX. Biotite decreases down hole and chlorite increases down hole to 220.9m. At 220.9m biotite becomes the domin
D	ML082	291.9	300.8										Patchy, weakly magnetic SGWK with minor beds of SSLT. This unit has limited alteration
D	ML082	300.8	303.5										Highly silicfied sediments with biotite and pyrrhotite forming along old bedding planes ans quartz and chlorite forming in veins.
D	ML082	303.5	308.4										Silicified SSLT and SGWK with pyrrhotite disseminated, in blebs and in fractures. There are also infrequent quartz and chlorite filled fractures and veins
D	ML082	308.4	311										Pyrrhotite rich banded STUF with a cherty appearance. This unit also has thick minor VQXLC's
D	ML082	311	330.1										dark gery SSLT and SGWK with pronounced bedding. Both silicification and and sulphide content decrease down hole as does veining. At 319.8 and 316.1m there are small bands of highly silicified SSLT ans SGWK containing epidote
D	ML082	330.1	331										Brecciated SSLT that has been partially re-cemented with calcite and pink quartz and minor chlorite. The clasts of SSLT are angular and do not include SGWK.
D	ML082	331	344.8										interbedded SGWK and SSLT with fractures filled with stilbite and calcite or chlorite
D	ML082	344.8	347.5										Light grey coarse grained SGWK with minor SSLT. This unit has a network of veins of epidote, quartz, chlorite and calcite
D	ML082	347.5	354.3										Coarse grained SGWK and medium grained SSLT with minor veins of calcite and epidote or quartz. Fractures filled with stilbite.
D	ML083	0	8.6										bt-porphyritic FGRA with minor saussuritization and tu alteration. Lower contact sharp.
D	ML083	8.6	10.3										si-bt-altered SSLT.
D	ML083	10.3	11.5										Porphyritic FGRA with tu-ep-si alteration and qz veinlets. A pegmatitic vein occurs at the upper contact. Upper and lower contacts sharp.
D	ML083	11.5	15.1										si-bt-altered SSLT transitional to STUF. Minor qz veinlets and disseminated flecks of po.
D	ML083	15.1	15.9										Porphyritic FGRA with sharp upper and lower contacts.
D	ML083	15.9	29.6										bt-STUF with bleached silicified bands. VQLX occurs with conspicuous cl/qz selvages. Minor disseminated po.
D	ML083	29.6	37.5										Porphyritic FGRA with icg equigranular to pegmatitic patches. Pegmatitic parch between 131.0 - 131.4 is strongly ep altered. Tu alteration moderated throughout. Poor core recovery conceals upper contact but the lower is sharp.
D	ML083	37.5	40.4										Strongly silicified and bleached ZXSCS. Possible siderite occurs with disseminated po.
D	ML083	40.4	52.4										Upper contact is sharp. Within 10cm of upper contact tu alteration is strong and associated with minor disseminated po. Body is icg equigranular bt-FGRA.
D	ML083	52.4	53.8										Extremely silicified ZXSCS partially assimilated with surrounding FGRA.
D	ML083	53.8	61.3										Away from assimilated margin FGRA is icg equigranular with minor tu alteration.
D	ML083	61.3	62.5										Broad zone of wall rock assimilation characterized by extreme silicification.
D	ML083	62.5	73.5										Silicified mt-rich ZXSCS. Disseminated po. Calc-silicate mineralogy appears to be almost exclusively dominated by dk gn amphibole. Lt gn si-cl patches give a mottled appearance.
D	ML083	73.5	96.4										Chloritic STUF possibly replacing ZXSCS. ZSKCS present as irregular patches and bands of mt+/-amhibole+/-po. Disseminated sulphide in STUF dominated bt po but minor cpy and arsenopyrite occur.
D	ML083	96.4	106.7										Transition from above marked by loss of mt-bands, decrease in abundance of cl and increase in abundance of bt. Relict sandy beds preserved. Very fine VQL veinlets occur. Disseminated sulphide is minor.
D	ML083	106.7	109.1										Conspicuous po-cpy-bt-rich and cl-po-cpy-rich bands with possible topaz.
D	ML083	109.1	123										bt-STUF with si-cl bleached bands. Distinctive veins dominated by qz+tu+po+/-cpy+/-topaz?+/-Fe-carbonate. 111.1m qz-tu vein approx 35%po 5%cpy. 113.6m qz-tu vein has produced an associated VQ stockwork with brecciated textures. 123.4m qz-tu vein contains
D	ML083	123	152.6										qz-tu vein marks contact. Top 1m of FGRA is gy and strongly tu-altered with distinctive tu spots with minor disseminated po associated. Body of FGRA is distinctly spotted qz- fl- porphyritic. Phenocrysts are subhedral, qz up to 1cm d, fl up to 2cm d. Tu a
D	ML084	0	43.7										Very weathered orange clay, mostly cohesive with moderate recovery in places. Original textures and grains are very hard to see, but are weakly present. Red hematite staining.
D	ML084	43.7	52										Weakly to moderately weathered dk/ltgy to wit fine grained sediment altered to clay in places. Minor relict VQL.
D	ML084	52	151.9										dkgy/gn fine to medium grained sediments of predominantly SSLT and SGWK bed. Chlorite alteration in veins and occasionally patchy in bedding. Minor VQ that occasionally contain po/cpy. Weakly to moderately magnetic. Clear bedding planes present. Minor si
D	ML084	151.9	156.5										Brecciated SSLT / SGWK fault zone. Breccia clasts range in size from 0.5 to 5 cm. Two small areas of gouge at 152.8 and 156 m. Chlorite vein networking in more cohesive rock. Orange/red hematite-quartz-cl veining from 155.2 to 155.9 m.
D	ML084	156.5	181.4										Fine to medium grained SGWK interbedded with SSLT. 156.5-157.8m after fault zone, contains cl vein networking. Minor cl, ep, stil, and qtz veining throughout rest of cohesive rock. Unit is moderately fractured with some areas becoming rubbly. Very wea
D	ML084	181.4	190										Brecciated fault zone with two small sections of gouge at186.5m and 189.5m. Cl alteration coats surface of fractured and rubbly rocks.

D	ML143	212.4	219.2										strongly banded mtZXS with mt rich bands and very soft d bn bt rich horizons (<30%). mt bands have ifg cc matrix. Sx's 10% po, 4% cpy and 2% apy occur as patches, ds and in veinlets. Very rare ifg sh.
D	ML143	219.2	220.4										alternating bands of pb gt-vs-cc, lam pxZHF and am-mt-cc ZXS with d/s sx's and discontinous branching veinlets (more abundant in amZXS)
D	ML143	220.4	222.8										mtZXS with mt and am rich bands with a cc matrix and a minor pb gt-ve-am interval. Sx's occur in patches d/s and in veins.
D	ML143	222.8	225.6										pb gt- vs-am with a fine matrix containing cc with intervals of amZXS and pxZHF. Ds sx's. within amZXS there are rounded sheelite blobs. <1% sh with apy and cpy sx's dominanted by po.
D	ML143	225.6	234.2										tnb-lam pxZHF po-am orbicules with bleached halos py-am-cl veins and discontinous veinlets.
D	ML143	234.2	237.1										bands of amZXS icg am with cc matrix with ds sx's. intervals of pb gt-ve±am with a ifg matrix containing cc. minor bands of pxZHF
D	ML143	237.1	239.4										lam to tnb px hornfells (st-sfg) d/s po and py rare po alt bands. Veins are sub // and cut across bedding and are often discontinous. po±am±px orbicules with bleaching halos. d/s sx's. minor microfaulting mm scale displacement in paler horizons.
D	ML143	239.4	247.6										intervals of btZHF with pxZHF and lesser altered ST. grainsize varies from st-sfg minor pb zones of gt-ve-cc. rare orbicules of am-po with bleaching halos. d/s sx's and thin discont veinlets.
D	ML143	247.6	251.1										st-sfg, mdb-tnb with minor px-bt-py alt, 20cm band of gn-cm pxZHF.
D	ML144	0	11.7										weathered fractured core at hop of hole. Comprises SST with minor px alteration.
D	ML144	11.7	18.6										tnb to mdb HF with px>bt alteration and short intervals of minimally altered SST. Bedding frequently offset by microfaulting (<1cm offset). Abundant veinlets qz-po occasionally concordant with bedding horions. Patchy vfg po alteration also. Px alteration
D	ML144	18.6	22										more strongly altered pxZHF than above. Creamy lgn to lpl px alteration surrounding intensely veined areas of alteration - giving near brecciated appearance in short intervals. mm scale faulting and fracturing.
D	ML144	22	23.5										strongly altered pxZHF with abundant thin po veins and thicker (<1cm) cc veins. ds po and patchy po alteration.
D	ML144	23.5	24.1										thin carbonate horizon. Wt sfg carbonate rich interval with abundant thin (<1cm) cc veins. Patches (<3mm) vfg po ds throughout. Appears porphyroblastic for 15cm interval - gn ?px porphyroblasts in carbonate matrix; also few porphyroblasts fr rd gt in carb
D	ML144	24.1	29.4										strongly altered pxZHF with abundant thin cc-po veins and patchy po alteration. px alteration concentrated around po veins. At 25.4m 60cm interval vzZXS: ms dun coloured vs apparently replacing merged gt porphyroblasts. Also pb texture with lbn gt porph
D	ML144	29.4	34.6										btZHF with lesser intervals pxZHF and minor minimally altered SS and ST. mm scale faulting.
D	ML144	34.6	39.6										strongly altered pxZHF with px alteration strongest around po-px veins. Patchy po alteration, patchy am also.
D	ML144	39.6	41.8										distinctive and uncommon regular lam-tnb creamy resinous lbn pxZHF with abundant very thin (<3mm) po veins; intricate network creating brecciated appearance. mm-cm scale faulting offsets tnb. Minor patches vfg po.
D	ML144	41.8	46.9										tnb-mdb sfg-smg dbn btZHF with px alteration surrounding veins and lesser intervals pxZHF. pxZHF contains po and px rich horizons of increased alteration concordant with bedding. 20cm interval at 46.6m of sx and cl rich carbonate.
D	ML144	46.9	61.2										sfg-smg tnb-mdb SST with minor bt alteration.
D	ML144	61.2	91.2										Interval of core fallen from vehicle - pieced together, however inaccurate and many core blocks lost position. Core from this interval can be poorly constrained. Comprises predominantly unaltered gy SST, variably fractured with cl on fracture surfaces, no
D	ML144	91.2	112.3										tnb sfg-scg predominantly unaltered SST. Very minor px and bt alteration. Non-magnetic, variably fractured. Short (<10cm) intervals of apparent pb texture - am pb with SST matrix with ?px pb at edge of intervals.
D	ML144	112.3	124.1										SST with increased px alteration compared with 91.2-112.3m but remains minor. Increased qz-cl and cl-po veining.
D	ML144	124.1	134.2										dgy sfg-smg SST with thin cl and sb veins. Short intervals bk SM.
D	ML144	134.2	138.9										dgy SST with spotted appearance: black rounded specks of 2-3mm diameter with equal hardness to host SST, which follow bedding horizons. ?early alteration of scg beds by px.
D	ML144	138.9	144.2										SST with increased px>bt alteration concentrated around veins. Second generation of pure po veins younger than qz-cl-sb veins. Non-magnetic.
D	ML144	144.2	145.7										fracture zone comprising gy SST with qz-cl and cc veining - fracturing predominantly along vein surface.
D	ML144	145.7	152.6										SST with minor bt and px alteration - blue tinged ?px alteration surrounding veins. Variably fractured with intermittent areas of spotted appearance. Increasing px alteration downhole but remains minor. Short intervals intensely qz-cl-sx veined.
