1 Summary

Exploration Licence 21/2005 located in western Tasmania currently includes two magnetite-tin-tungsten resources, namely the Mt Lindsay Main and No.2 deposits, and several advanced skarn and greisen prospects including the No.1, Waterhouse, Eastern and Webbs Creek greisenised skarns and the North Cashbolt greisen. Activities within EL21/2005 were focussed on the completion of a Bankable Feasibility Study (BFS) into the development of the Mt Lindsay Main, Mt Lindsay No.2 and Reward tin-tungsten-magnetite deposits, and included completion of core logging and assaying, resource modelling, extensive metallurgical test work, geotechnical and hydrogeological assessment and modelling, resource estimation, mining studies, process design, environmental studies and financial modelling of bankable standard.

Exploration activities during 2012-2013 were focussed on the North Cashbolt, Upper Harman and Salmons Creek areas where a total of 450 soil samples and 47 rock samples were collected and assayed. An analysis of Venture's entire Mt Lindsay Project soil geochemistry data set was also carried out to characterise basement lithology signatures, refine interpretation of the basement geology and enhance the recognition of geochemical signatures associated with skarn and greisen mineralisation.

2 Introduction

Exploration Licence 21/2005 is situated in the tin-tungsten province of western Tasmania and covers the south eastern contact metamorphic aureole of the Meredith Granite. The Meredith Granite is part of a suite of Devonian granites which is very important to tin-tungsten mineralization in Tasmania, and deposits associated with this suite include the world class Renison Bell tin mine (26 Mt at 1.46% Sn), Mount Bischoff (10.54 Mt at 1.1% Sn), Cleveland (12.4 Mt at 0.62% Sn, 0.25% Cu) and King Island (17 Mt at 0.85% WO_3). Cleveland and Mount Bischoff are situated around the northern margin of the Meredith Granite, and Renison Bell is associated with the Pine Hill Granite c. 15 km to the southeast of the Meredith Granite.

Previous exploration activities mainly for tin within the area now covered by E21/2005 also indicated the presence of potentially economic magnetite skarns. There are currently two producing magnetite mines in Tasmania, the Kara magnetite-scheelite mine located near Hampshire approximately 55 km in a direct line northeast of EL21/2005 and the Savage River magnetite mine (371 Mt at 31.9% Fe in magnetite) situated c. 25 km directly north northwest of the Mt Lindsay magnetite-tin-tungsten skarns within EL21/2005.

3 Location and Access

EL21/2005 currently covers 74 km^2 and is located approximately 130 km by road southwest of the port of Burnie, and c. 35 km by road from the nearest town Tullah (Figure 1). Access to the licence is via the sealed (bitumen) Pieman Road which branches off the

Murchison Highway c. 5 km north of Tullah, then approximately 3 km of 4WD vehicle track to the drill site. The drill site is c. 3 km from Hydro Tasmania transmission lines (adjacent to the Pieman Road) and 21 km from the Bastyan hydroelectric powerhouse and Emu Bay Railway which connects with the port of Burnie.

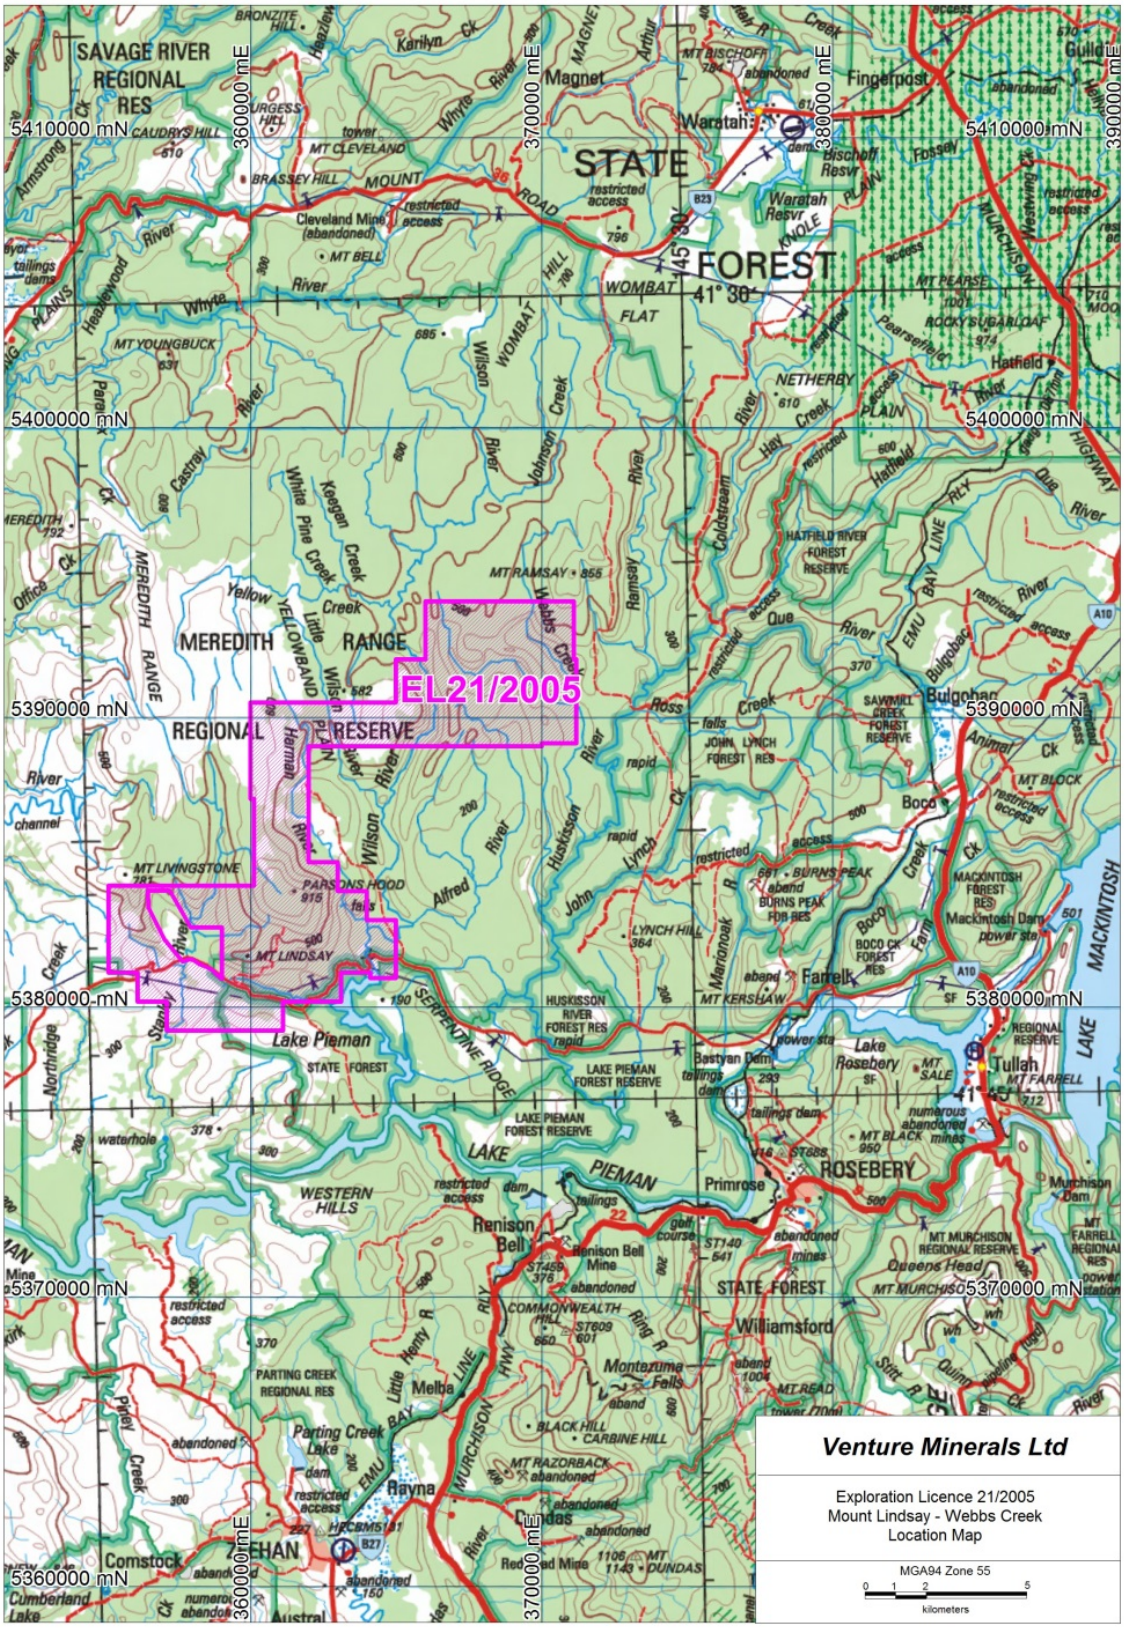

Figure 1: EL21/2005 Location Plan

Elevation within the licence ranges from 100 m above median sea level where Lake Pieman winds around the south western corner, to 913 m at the top of Parsons Hood at the southern end of the Meredith Range. Other highpoints include Mt Lindsay (579 m) on a spur branching southwest off Parsons Hood, and Mt Livingstone (781 m) beyond the western boundary. Average annual rainfall is approximately 2000 mm and vegetation is dominated by temperate rainforest, with patches of dense sub-alpine scrub over granitic basement and in areas of regenerating forest.

4 Exploration and Mining History

Please refer to previous annual reports for reviews of past exploration and mining (e.g. Owen, 2009).

5 Geological Setting and Mineralisation Style

The south western part of EL21/2005 is underlain by northwest striking sedimentary and volcanic rocks of the Neoproterozoic – Early Cambrian Crimson Creek Formatio and Success Creek Group and Neoproterozoic Oonah Formation which are intruded to the northwest by the Devonian Meredith Granite (Figures 2 and 3). The north eastern corner of EL21/2005 (the Webbs Creek area) is underlain mainly by Silurian to Devonian quartz-rich sedimentary rocks of the Eldon Group, a narrow belt of the Ordovician Gordon Limestone, Cambrian volcanogenic sedimentary rocks to the far east and the Meredith Granite to the north. The sedimentary stratigraphy is largely steeply dipping to vertical.

The intrusive contact of the Meredith Granite dips away at a modest angle beneath the various sedimentary units, but in detail the granite margin is complicated by numerous irregular granitic dykes, shelves and apophyses which appear to stope the host meta-sedimentary and meta-igneous units. There are also large rafts of Crimson Creek and Success Creek rocks within the margins of the Meredith Granite. Preliminary interpretation suggests several phases of granite intrusion culminating in late stage quartz-tourmaline veining and the localised development of quartz+tourmaline±topaz and sericite±siderite greisens.

A broad contact metamorphic aureole is developed around the Meredith Granite, characterised by the development of fine grained amphibole, cordierite, biotite and pyroxene hornfels. Carbonate units are locally present within all of the enclosing sedimentary units and locally form the protolith to a variety of proximal contact skarns, greisenised skarns and more distal carbonate replacement bodies. The principal exploration target for Venture Minerals within EL21/2005 is greisenised skarn and carbonate replacement style tin and tungsten mineralisation, followed by vein and greisen style tin and tungsten mineralisation. The term “skarn” is used in a very broad sense when referring to the Sn-W-magnetite deposits and targets within EL21/2005, encompassing calcsilicate skarn, carbonate replacement and greisen styles of alteration and mineralisation. The mineralisation is largely metasomatic but it is highly likely that some of

the early calcsilicate assemblages are to some extent contact metamorphic. The following more specific terms may be applied: (exo)skarn for calcsilicate alteration outside the granite; endoskarn for calcsilicate alteration inside the granite; exogreisen for K, B & F alteration outside the granite; (endo)greisen for K, B & F alteration inside the granite; hornfels for fine grained contact metamorphic rock. Grain size is strongly controlled by protolith: macrocrystalline skarn and greisens were developed from carbonate and granitic protoliths, microcrystalline skarn and greisen from fine grained impure carbonate and siliciclastic protoliths.

Six potentially economic magnetite-tin-tungsten deposits, namely the Main, No.1, No.2, Waterhouse, Eastern and Webbs Creek skarns, are currently identified within EL21/2005 in the sedimentary rocks adjacent to the contact of the Meredith Granite. One potentially significant vein and endogreisen tin prospect, North Cashbolt, is recognised within the Meredith Granite. The Main, No.1, No2, Waterhouse and Eastern skarns are hosted by calcareous sandstone horizons within the Crimson Creek Formation, the Livingstone and Reward skarns by thickly bedded dolomite in the Success Creek Group, and the Webbs Creek skarn by the Gordon Limestone (Figure 2). Carbonate horizons in the upper Success Creek Group and basal Crimson Creek Formation also host the massive Renison Bell Tin deposit 15 km along strike to the southeast. The Gordon Limestone is host to the Kara magnetite-scheelite skarns adjacent to the Housetop Granite approximately 45 km directly northeast of Webbs Creek.

Within the identified skarns the rock forming minerals are garnet, vesuvianite, pyroxene, calcite, siderite, quartz, magnetite, pyrrhotite, amphibole, biotite, fluorite, serpentine, olivine, calcite, borates (vonsenite-ludwigite and hulsite), axinite, humite and chondrodite with a supergene goethite+hematite overprint to a depth of up to c. 150 m beneath surface. Minor to trace alteration phases include cassiterite, scheelite, chalcopyrite, arsenopyrite, potassium feldspar, fluoborite, wollastonite, titanite, ilmenite and danalite. Potentially commercial minerals include cassiterite, scheelite, chalcopyrite, magnetite and hematite. Cassiterite is the main tin phase at Mt Lindsay, although borates (vonsenite-ludwigite and hulsite) are important in some proximal low-grade situations. Scheelite is the only significant tungsten mineral, with a little wolframite observed in metallurgical concentrates. Venture's exploration activities to date have been focussed on identifying and defining commercially exploitable zones of magnetite, cassiterite and/or scheelite mineralisation.

All of the identified skarns are zoned both spatially and temporally. The spatial zonation is developed on a scale of 10s to 100s of metres approximately perpendicular to the granite margin and reflects principally proximity to fluid source and protolith type, the importance of the latter decreasing with inferred increasing fluid to rock ratio. In the calcic skarns the zoning ranges from proximal garnet, borate, magnetite and annitic biotite alteration through pyrrhotite and amphibole alteration zones to distal quartz+siderite+cassiterite carbonate replacement and phlogopitic biotite alteration. The pyroxene zone is largely restricted to peripheral impure carbonate and siliciclastic protoliths. The Reward and Livingstone magnesian skarns are broadly zoned from proximal olivine, borates, magnetite, through siderite+cassiterite to distal pyroxene alteration. Temporal zoning is indicated by successive replacement textures, and typically comprises early calcsilicate stages, temporally intermediate quartz, siderite, borate, amphibole, magnetite and pyrrhotite stages, and late biotite, fluorite, chlorite and sericite stages. Most of the cassiterite and

scheelite mineralisation observed to date seems to be associated with the temporally intermediate stages of mineralisation (greisenisation stage).

More detailed descriptions of the alteration and mineralisation encountered in the various identified deposits can be found in previous annual reports (e.g. Owen 2011, Owen & Pfeifenberger 2012) and Appendix G.

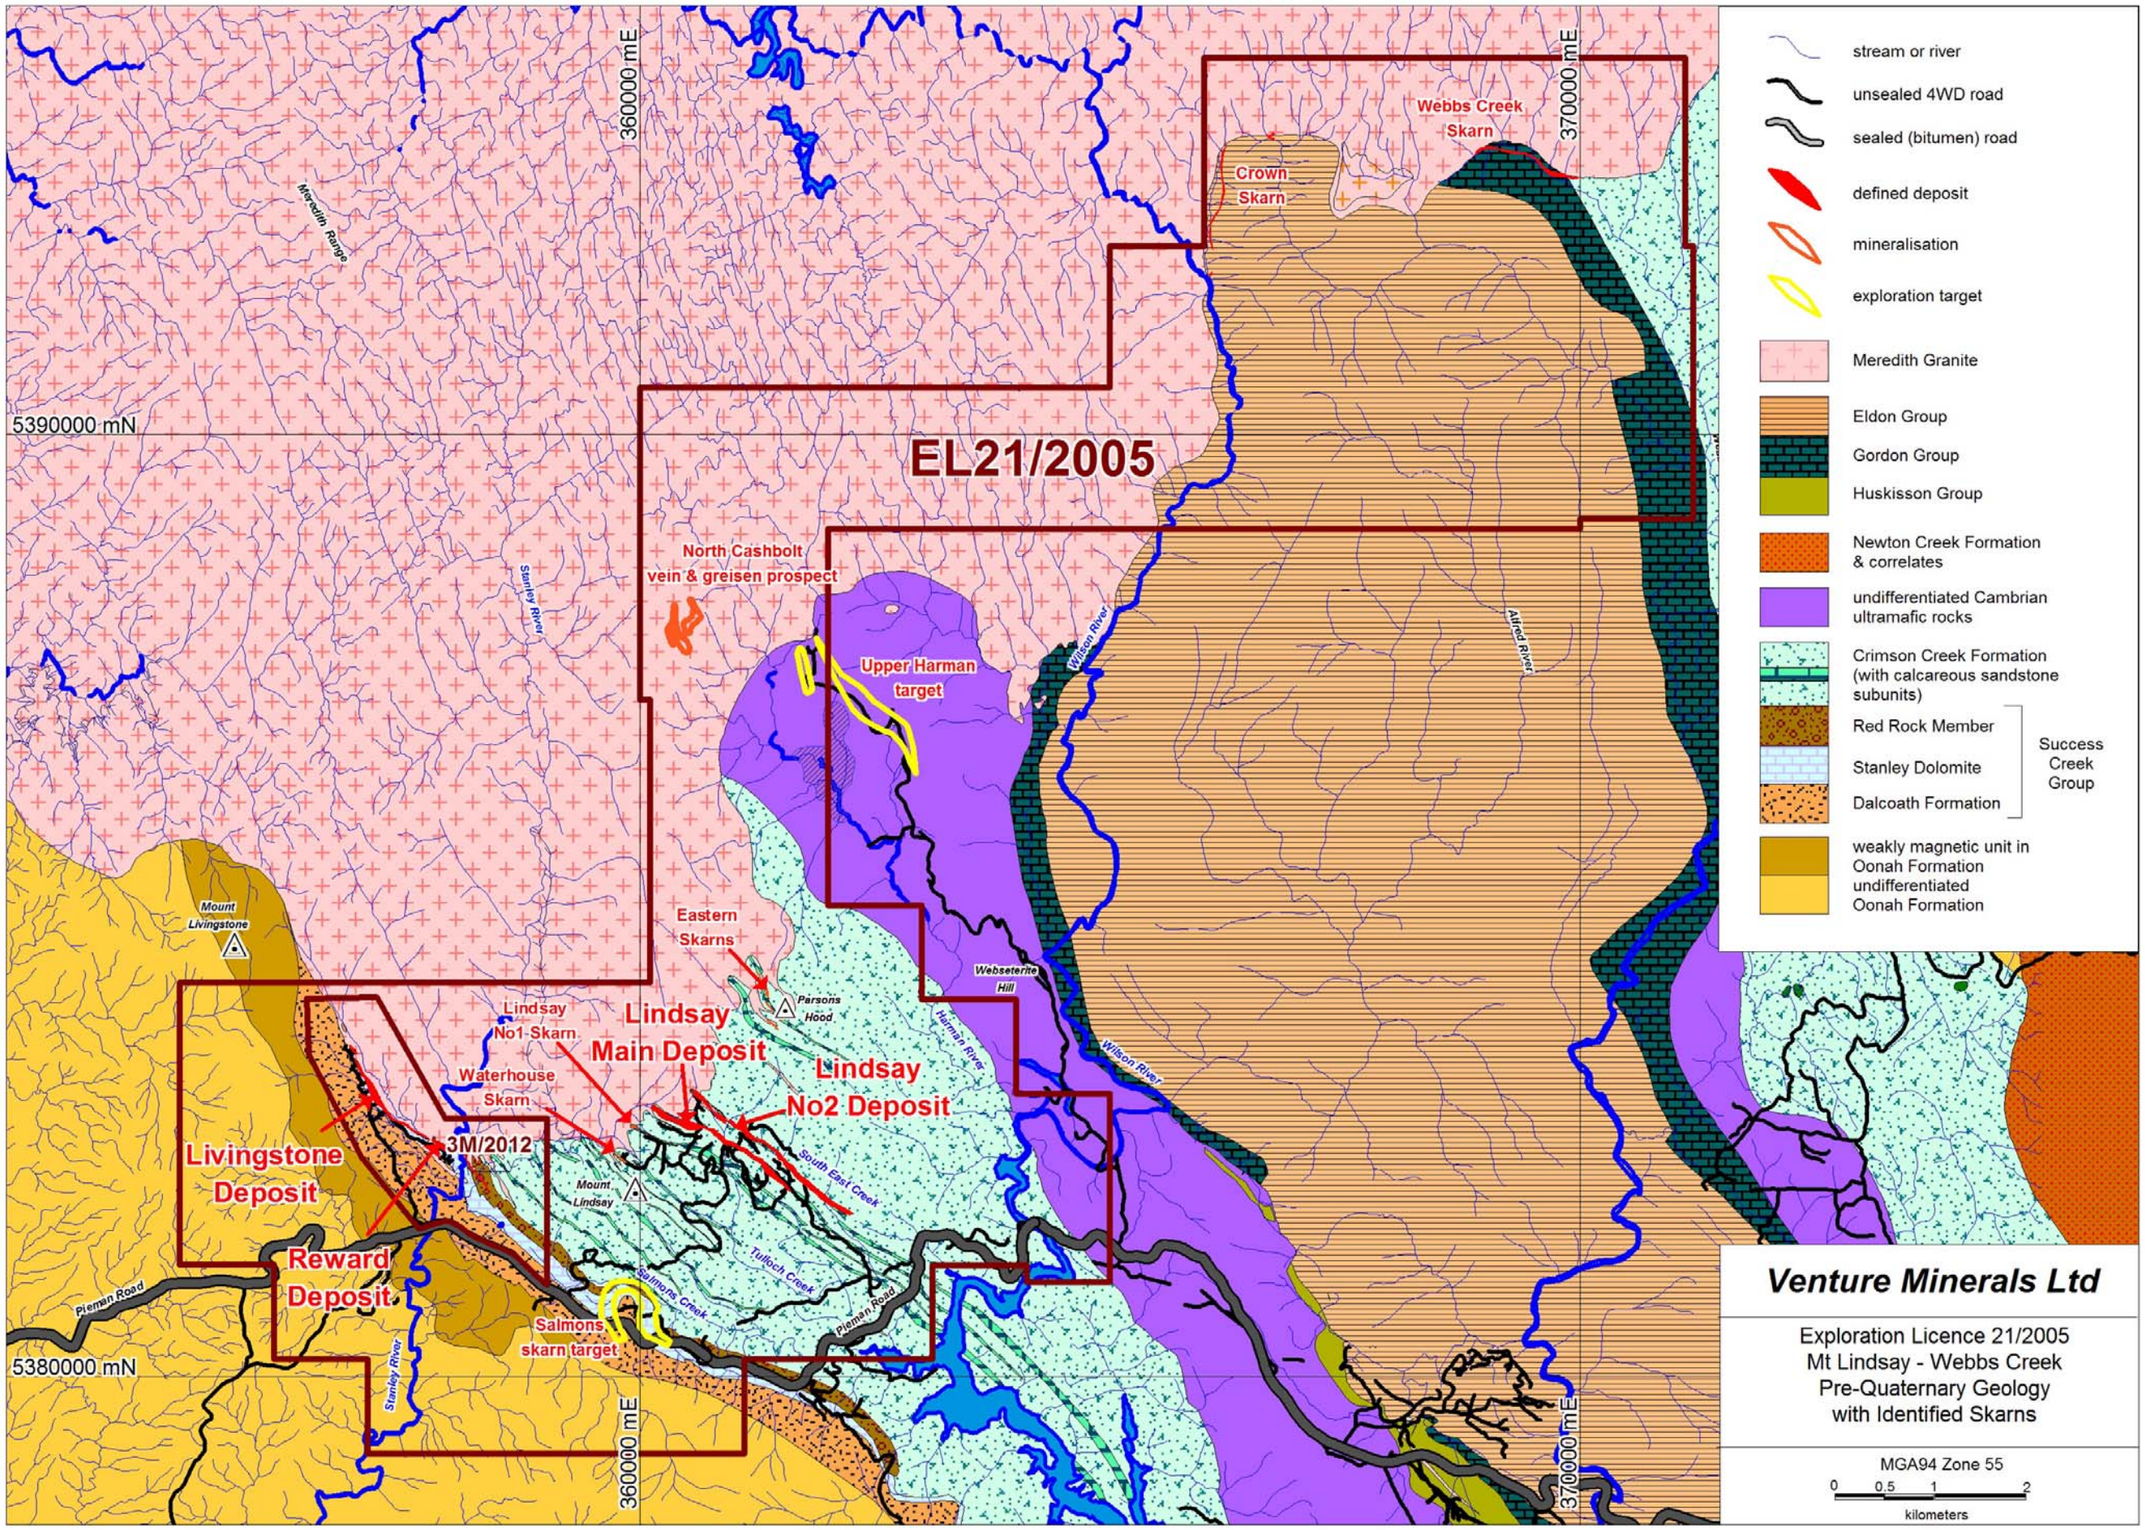

Figure 2: Project Geology

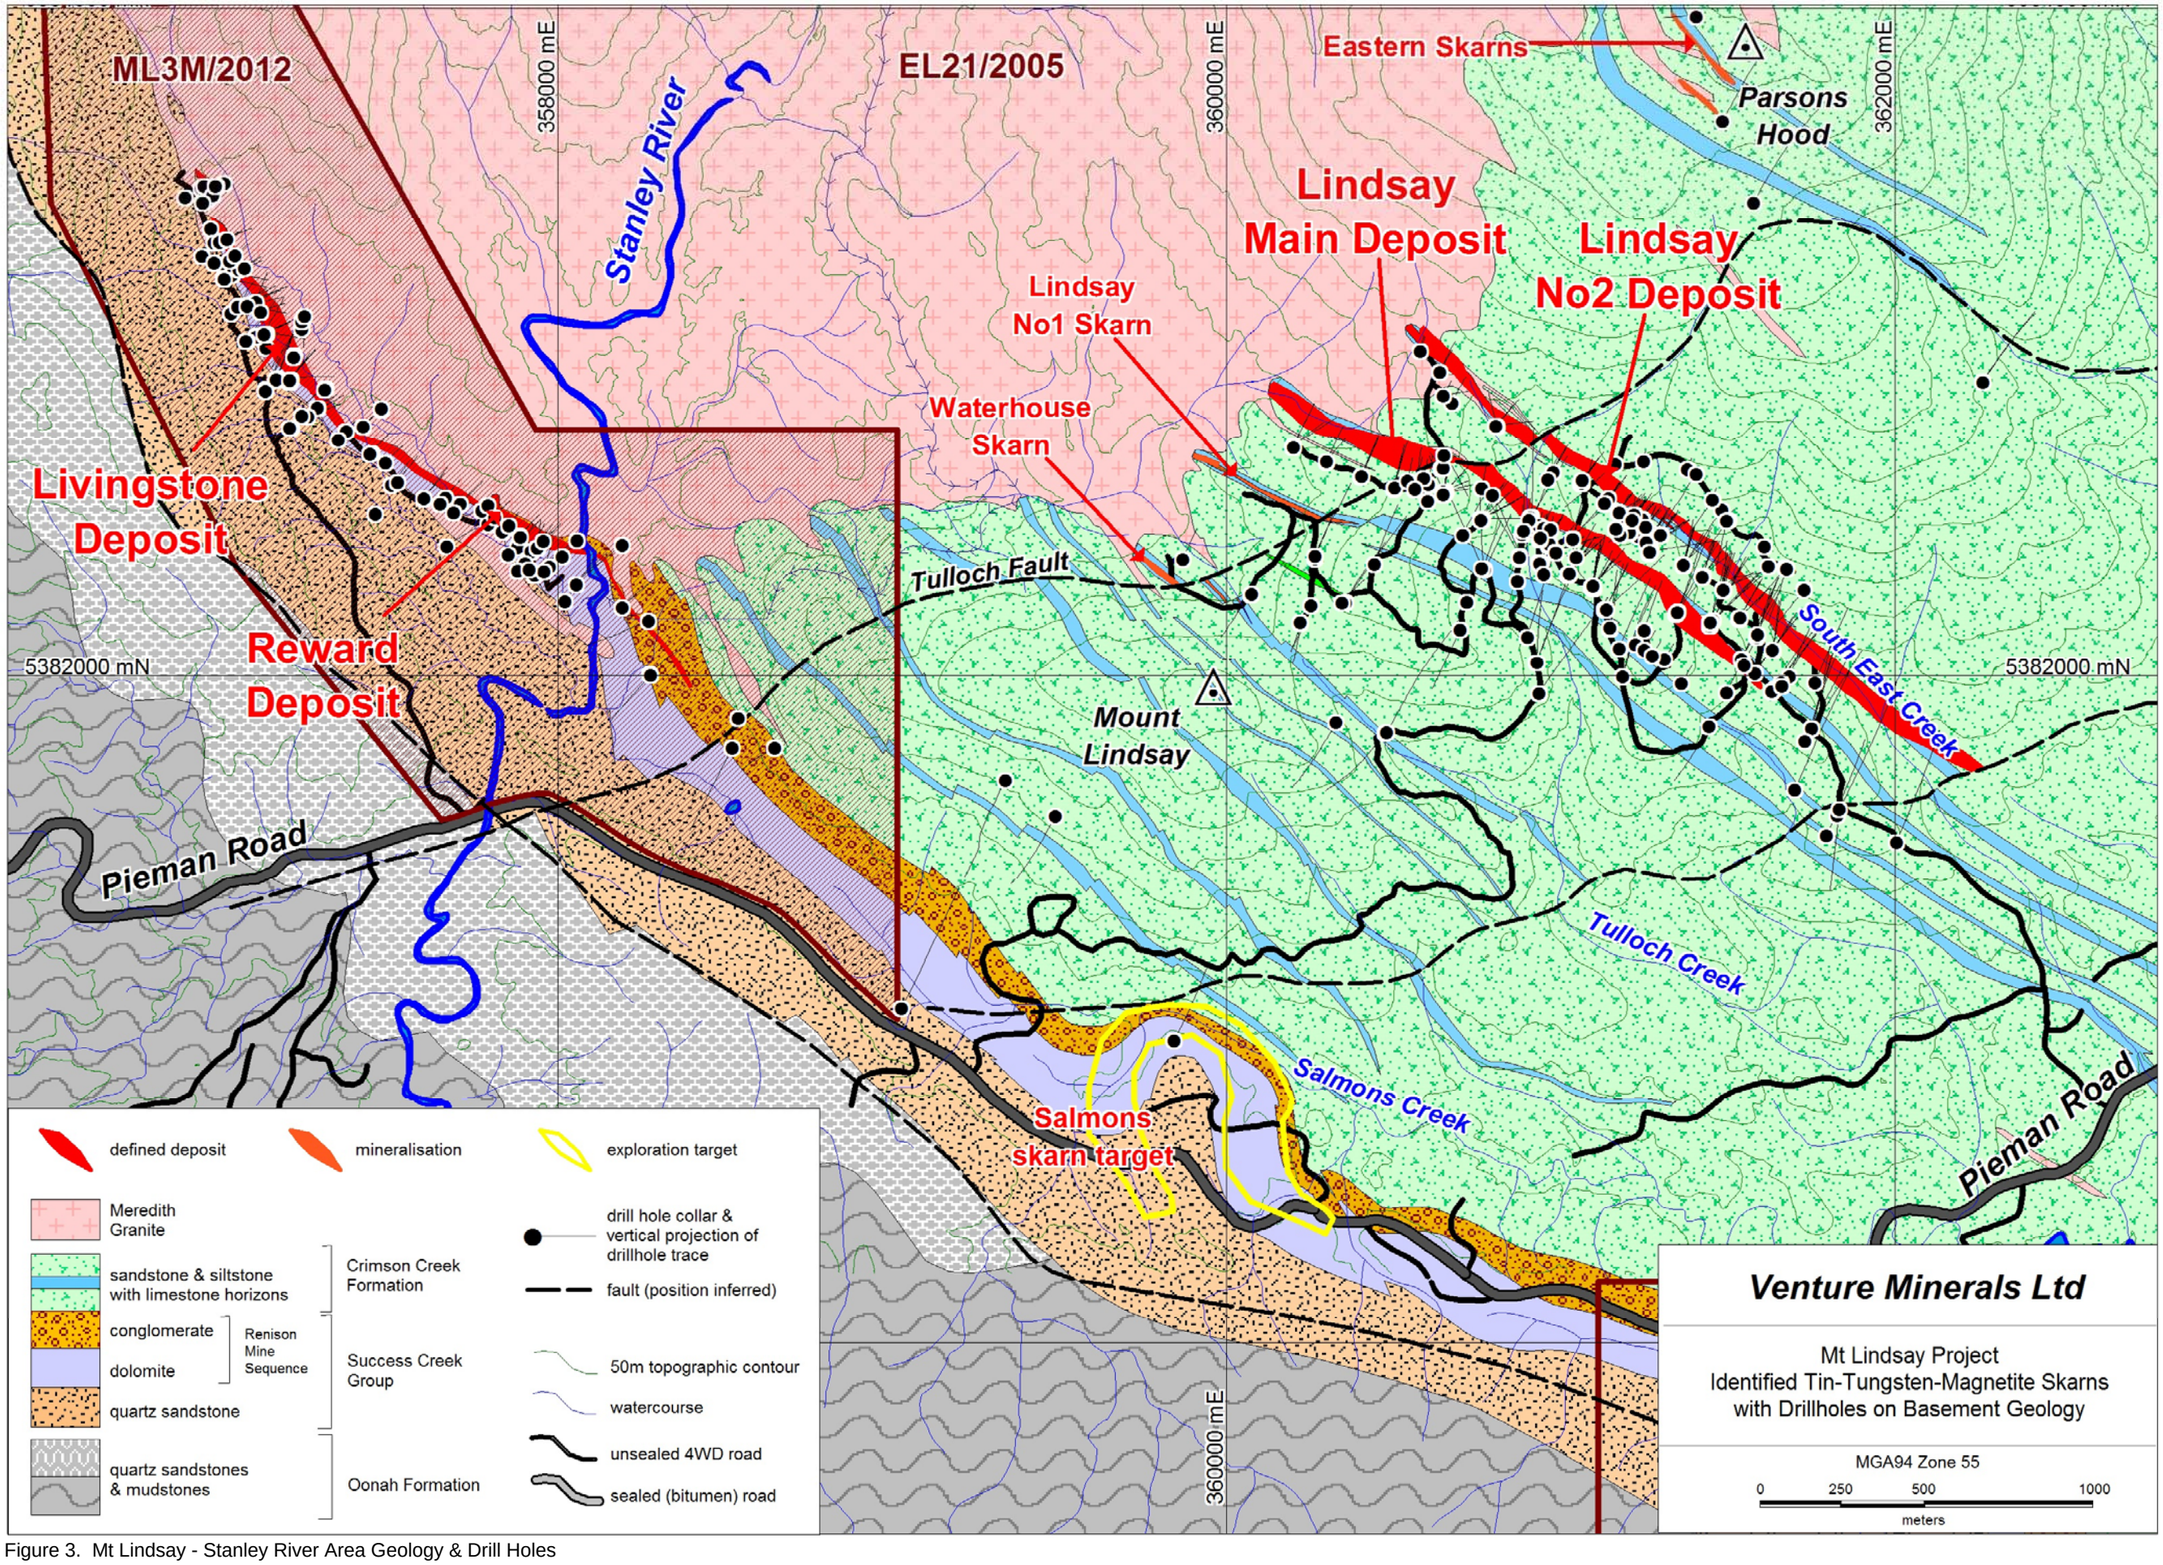

Figure 3. Mt Lindsay - Stanley River Area Geology & Drill Holes

6 2012-2013 Anniversary Year Exploration Activities

Activities during the 2013 anniversary year included logging and assaying of drill core (from drilling completed just prior to start of tenement anniversary year) flora and fauna surveys, metallurgical test work, geotechnical and hydrogeological assessment and modelling, resource estimation, mining and environmental studies as part of a Bankable Feasibility Study (BFS) into the development of the Main, No.2 and Reward tin-tungsten-magnetite deposits. The draft resource estimation and metallurgical reports are included in Appendices G and H, the mining and environmental studies will be reported in due course. Beyond the Main and No.2 deposits exploration activities were focussed on the North Cashbolt, Upper Harman and Salmons Creek areas where a total of 450 soil samples and 47 rock samples were collected and assayed as described below. An analysis of Venture's entire Mt Lindsay Project soil geochemistry data set was also carried out to characterise basement lithology signatures, refine interpretation of the basement geology and enhance the recognition of geochemical signatures associated with skarn and greisen mineralisation. The preliminary findings of this analysis are also summarised below.

6.1 Preliminary Findings of Mt Lindsay Project Geochemistry Analysis

Venture has initiated an analysis of its considerable surface and dill hole assay data set with the objective of identifying patterns in soil and rock geochemistry which will assist the discovery of blind (un-exposed) deposits and high grade tin and tungsten zones within identified skarns. A two-pronged approach is being used to achieve this:

i. Characterise the soil geochemical profiles associated with the various geological units within Venture exploration tenure, and;

ii. Characterise the geochemical signatures associated with Mt Lindsay-style mineralisation.

This geochemical characterisation is already helping to refine interpretation of the basement geology in the Mt Lindsay Project area and highlighting some key geochemical trends associated with mineralisation. This assessment is ongoing but some preliminary findings are summarised below.

Project Soil Geochemical Assessment

Some 2485 soil samples collected by Venture from the Post Office Creek (EL33/2007), Paradox Creek (EL24/2008), Contact Creek (EL31/2003 & EL36/2003) and Mt Lindsay (EL21/2005) areas were combined into one geochemical data set. All soil samples have been assayed for Sn, W, Ag, As, V, Ba, Be, Bi, Cr, Cu, Li, Ni, Pb and Rb. Some 1269 of the 2485 samples were also tested for a larger suite of elements including Fe, Al, Ca, Cd, Ce, Co, Cs, Ga, Ge, Hf, In, K, La, Mg, Mn, Na, Mo, Nb, P, Re, S, Sb, Se, Sr, Ta, Te, Th, Ti, U, V, Y, Zn and Zr. Samples with results below the analytical detection limit were assigned a value of half the detection limit, and results greater than the detection limit were assigned

the upper detection limit value. Each soil sample was assigned a lithological code according to available geological mapping and interpretation.

The soil data was statistically analysed to determine particular elements, ratios and ranges which were unique to each lithology. Using the determined geochemical profile for each lithology in conjunction with geological and structural mapping, outliers from specific populations were identified and the lithology recoded, allowing refinement of the interpreted geology. By determining the background element abundances of differing lithologies discreet increases in skarn-associated elements are easier to identify. The results of this analysis are summarised in Table 1 and Appendix I.

Table 1: Summary soil geochemistry according to rock units

Geological Unit	Geochemical Features	Distinguishing Elements
Crimson Creek Formation	Elevated Co, V, Ti, Ni, Zn, Cu, Cr, Ga. Fe, Al, As, Mn and Zr. Indicates the sediments are derived from a source with a mafic volcanic component.	Ti, Ga and V
Meredith Granite	Elevated K, Rb, Th, Na, B and Ce. Very low abundance of ferromagnesian elements, typical of acidic composition.	Th, Rb and K
Red Rock Member (Success Creek Group	Intermediate composition with influence from both mafic and acidic sediment sources. Scattered high abundances of Ba, Pb and Fe.	No particular distinguishing element. Collectively the moderate to low abundance of mafic elements and scattered high Fe and Ba values can distinguish it from the ferric Crimson Creek and the geochemically mature Stanley Dolomite, Dalcoath Fm and Oonah Fm.
Stanley Dolomite & Dalcoath Formation (Success Creek Group)	Geochemically mature composition with comparatively low mafic element abundances and moderate acidic elements. Geochemically soils cannot be distinguished between the two units.	No distinguishing elements. Can be separated from the Crimson Creek and Red Rock Member by low mafic element abundance and a moderate acidic element composition.
Oonah Formation	Very low abundances of all elements with minor increases in Rb, Ba and Zr. Characteristic of mature sediment (ie. Oonah Fm. quartz wacke).	Easily distinguished by its low element abundances and low deviation.

Geochemically the Crimson Creek Fm is well defined by its comparatively high abundances of mafic associated elements (Ni, Cr, Cu, Ga, V, Mn, Fe, Ti) (Figure 4 and Appendix I). The Success Ck Gp has low mafic element abundance and increased

amounts of Rb, K and Ba with minor differences between its constituent units (Red Rock Member, Dalcoath Fm and Stanley Dolomite). The Oonah Fm is readily identifiable by its low abundance of most elements and its low deviation, and finally the Meredith Granite is compositionally very different from the local lithologies by its high abundances of Rb, Be, B, Ce, Th, K and Na.

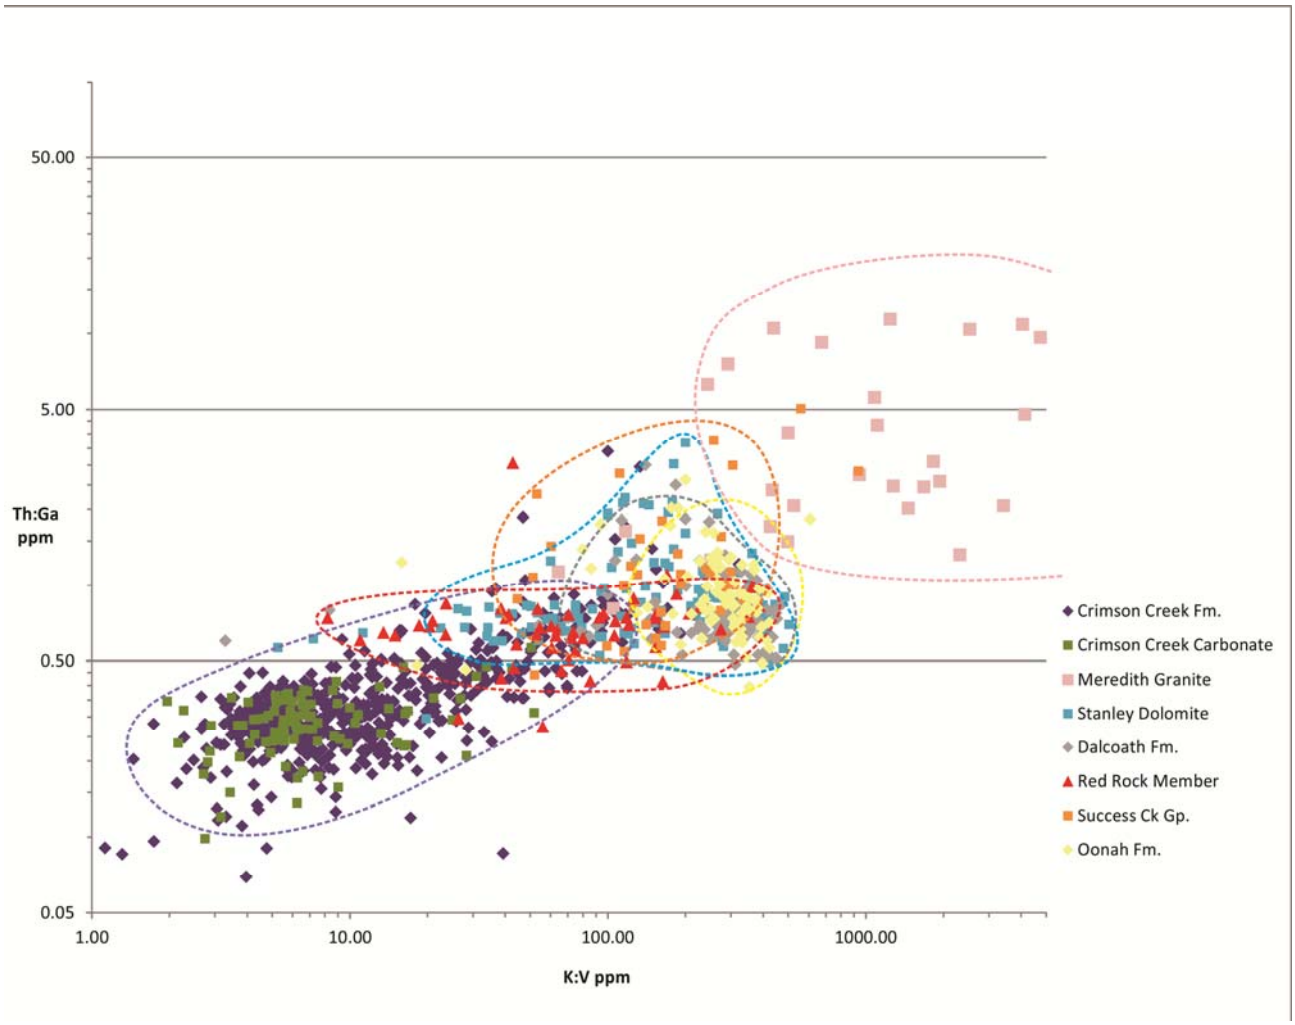

Figure 4. Soil sample population groupings according to lithological unit.

Mt Lindsay Drill Core Lithology Geochemical Assessment

The geochemistry associated with greisenised skarns is extremely complex due to the interaction of multiple, overprinting stages of alteration with a variety of sedimentary protoliths. At Mt Lindsay limestone, impure carbonate horizons and volcanogenic siltstones and sandstones of the Crimson Creek Formation have been progressively altered by contact metamorphism and metasomatism associated with the heat and fluids released by intrusion and crystallisation of the Meredith Granite. Contact metamorphism is considered to be essentially chemically closed system whereby heat causes recrystallization of rocks and the development of new minerals, without changing the overall chemistry of the parent lithology (most specifically Fe, B, F and K metasomatism). Metasomatism is an open system in which fluids and/or gases change the bulk chemistry and mineralogy of the rocks,

and in the case of the identified Mt Lindsay mineral deposits the major element fluxes appear to be Fe, B, F and K, with additional minor although ecomnincically significant introduction of Sn, W, Cu and a broad range of other minor and trace elements. Skarn formation typically involves multiple stages of magmatic fluid release and alteration, each producing mineral assemblages of unique geochemical character. Currently five major temporal stages of skarn development have been recognised at Mt Lindsay on the bases of mineralogical and textural observations:

1) Garnet+vesuvianite+pyroxene skarn (calcsilicate stage), mainly metasomatic with some contact metamorphic component. Maybe early scheelite mineralisation but Sn <500ppm in the calcsilicate skarns.
2) Prismatic quartz+siderite+cassiterite skarn favouring the core of the host carbonate with minor overlap with calcsilicate stage skarn. Mixture of infill of veins and cavities and replacement mineralisation.
3) Borate+amphibole+calcite skarn, widely overprints the garnet+vesuvianite+pyroxene stage and possibly the prismatic quartz+carbonate+cassiterite stage.
4) Biotite+magnetite+pyrrhotite alteration overprints garnet-vesuvianite-pyroxene skarn, quartz-siderite and borate-amphibole stages. Veins suggest some further precipitation of cassiterite, scheelite, quartz and siderite along with chalcopyrite and arsenopyrite.
5) Fluorite+biotite greisenization of previous stages. Local brecciation and extensive to near complete replacement of previous

The aim of the current assessment is to determine the geochemical profile associated with the key mineralising stages so that regional targets can be better assessed for their Sn and W exploration potential. To achieve this some 6977 assayed core samples from the Mt Lindsay Main, No.1 and No.2 deposits have been assigned lithologic codes to determine the typical geochemical characteristics of the host rocks, alteration and mineralised lithologies. The preliminary results clearly show the Mt Lindsay skarns exhibit progressive Fe, B, F and K enrichment, with Fe depletion associated with the final stage of greisenisation. Figure 5 shows the iron enrichment trend from early skarn lithologies overlapping with the sedimentary compositions through to late skarn and greisen lithologies diverging away from the protolith trend. Early garnet-vesuvianite-pyroxene and quartz-carbonate rocks exhibit Si and Fe-enrichment compared to their calcerous sedimentary protoliths, while subsequent skarn alteration stages show progressive Fe-enrichment and Si-depletion well beyond the protolith fields. Fe-depletion and Si-enrichment is associated with biotite and fluorite greisenisation, known from mineral replacement textures to be the last significant stage of alteration at Mt Lindsay. Progressive enrichment of elements such as Fe, B, F, K, Sn, W, Cu As, Be and Bi is accompanied by depletion of elements such as Al, Ba, Ca, Mg, Na, Ti and Si (e.g. Figure 6).

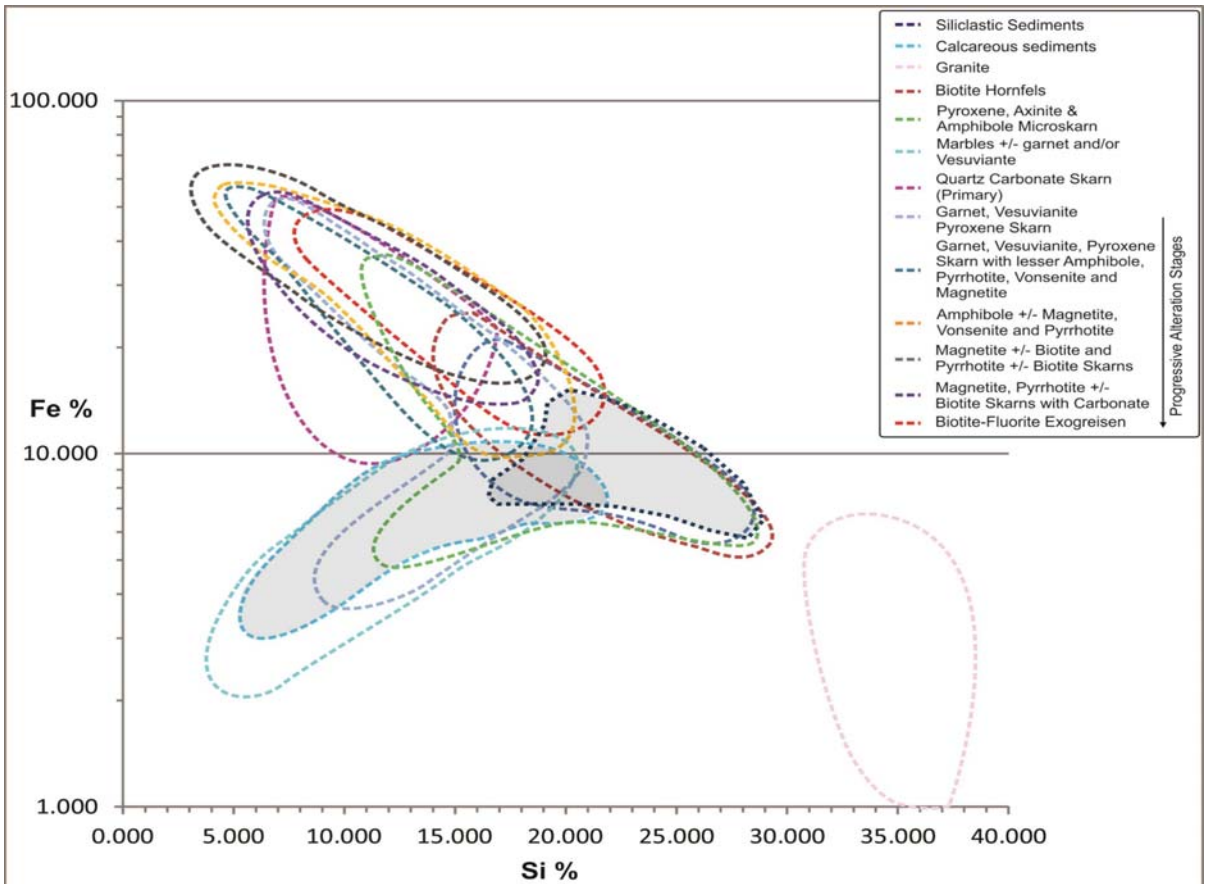

Figure 5: Iron-silica chart for Mt Lindsay lithologies. Granite has the isolated Si-rich and Fe-poor field at right, while the sedimentary lithologies form a curving continuum from Si and Fe-poor limestones through Si and Fe-intermediate volcanogenic sediments to Si-rich and Fe-poor quartz-rich sediments.

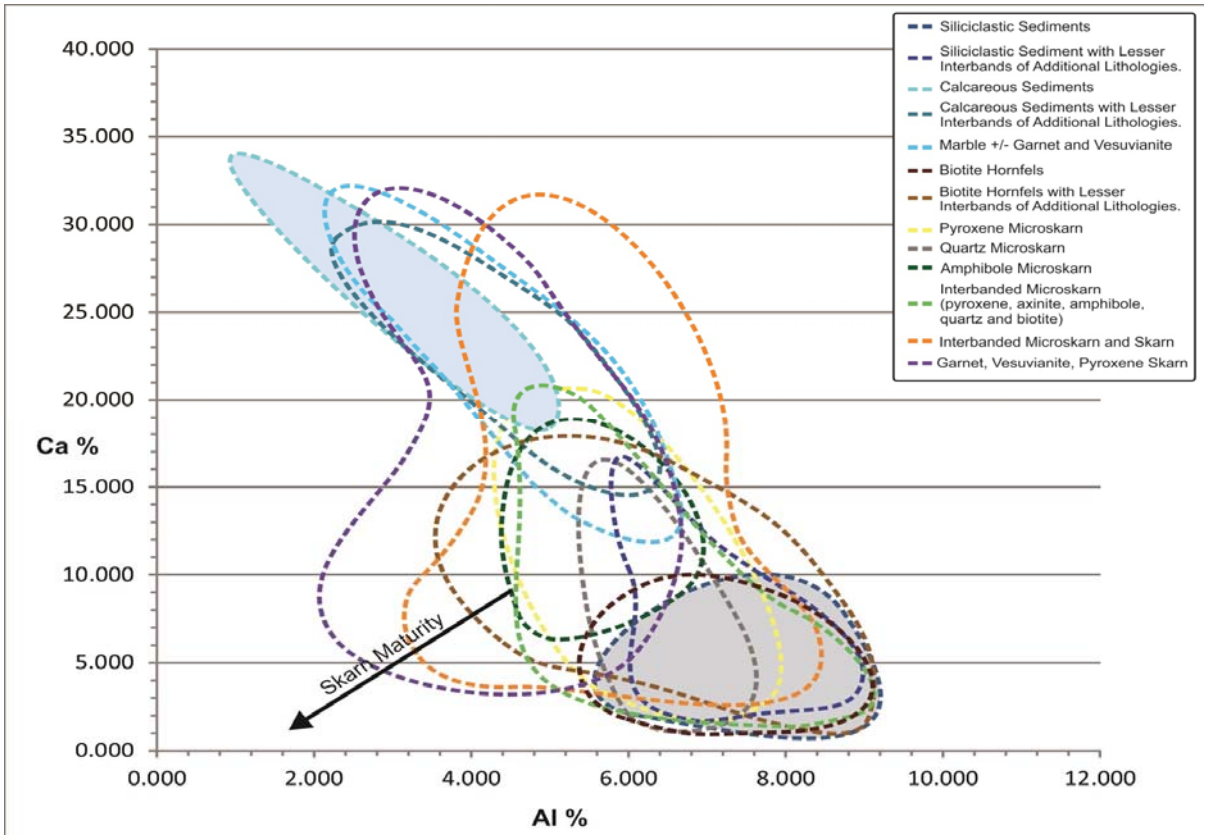

Figure 6: Ca versus Al ranges of principal Mt Lindsay sedimentary and alteration lithologies.

6.2 North Cashbolt Tin Prospect

The North Cashbolt tin prospect is a quartz-tourmaline endogreisen located within the Meredith Granite approx. 6 km north of Mt Lindsay and c. 4 km NNW of Parsons Hood. The prospect lies on the shoulder of a subalpine granite ridge where the dominant vegetation is buttongrass and low tea tree, hakea & banksia scrub. Access is easiest by helicopter with the nearest vehicle access being a quad bike track that terminates in dense scrub ~1.3 km to the east of the prospect.

Historic trenching and shaft sinking at North Cashbolt (formerly known as Tadpole Hill) was centred over a localised zone of intense tourmalinisation. Stream sediment, soil and rockchip sampling by Comstaff Proprietary Ltd in the 1970's confirmed the tourmalinised zone was coincident with geochemically anomalous Sn, As, Pb and lesser Cu and W. Quartz-tourmaline alteration seemed to be associated with north trending jointing within the granite and composed of thin veins and broader tourmalinised zones of similar, though still variable orientation (Comstaff 1972). High Sn grades were observed to be typically associated with green tourmaline within the generally black-brown tourmalinised zone. Whilst rock chip samples yielded up to 4.4% Sn, channel samples from freshly re-exposed trenches yielded lower values, averaging 0.24% Sn over 43.5m in the largest trench (Comstaff 1973). From this work the Sn mineralisaton at North Cashbolt was interpreted to cover an area approx.120 by 370 m and potentially contain 39,660 tonnes per vertical meter at a grade of 0.25% Sn (Schellekens, 1978). Subsequent infill soil sampling, mapping and geophysical surveys by Renison and Gold Fields Exploration in the 1980's confirmed the area's prospectivity for moderate to large tonnage low-grade Sn mineralisation (Roberts & Martin, 1982). However, no further work was carried out after 1984 due to low tin prices at that time (Cartwright, Komyshan & Roberts, 1984).

In January 2013 Venture conducted helicopter-supported mapping and rock-chip sampling at North Cashbolt, with the aim of locating of historic workings and refining the extent of the toumalinised zones and soil Sn-anomalies as mapped by Gold Fields (Cartwright, Komyshan & Roberts, 1984). One geologist and one field assistant spent four days mapping and rock chip sampling. It was intended to carry out continuous channel sampling over the soil anomalies but limited in situ outcrop hampered this and a series of short rock chip traverses were conducted instead.

Mapping at North Cashbolt yielded similar results to mapping done by previous workers. Though definitively in situ outcrop of tourmalinised granite is limited, significant subcrop and boulder float helps to define a broad ~300 by 100 m zone of coarse grained quartz-tourmaline alteration trending north. The alteration zone is spatially coincident with a NNW trending Sn-soil anomaly, as well as a plateau-like topographic feature within the otherwise moderate to steep relief of the area. Alteration stringers associated with quartz-tourmaline veins extend SE down the gently sloping southern face of the plateau and are coincident with a fork in the southern part of the soil Sn-anomaly. An second soil Sn-anomaly on the steeper eastern side of the plateau, trending NE seems to be the product of a localised Sn-source that is being distributed downslope by drainage and rock fall.

Around the periphery of the tourmalinised zone to the west and north outcrop/subcrop and float is scarce--inferred to reflect zones of argilised granite as mapped by previous workers (Cartwright, Komyshan & Roberts, 1984). Changes in the amount and type of exposure are coincident with changes in vegetation height and density which may help track the argillised granite boundary to the north. To the east of the tourmalinsied zone are numerous large boulder outcrops of fresh, coarse-grained granite, often containing small millimetre – centimetre scale resistant quartz-tourmaline nodules and minor prominent, planar ~N-S trending quartz-tourmaline veins.

Rock chip sampling over the tourmalinised zone averaged 0.2% Sn, confirming the generally low grade nature of the prospect. A maximum value of 5.32% Sn was obtained from a handful of samples lying on a linear NNW trend parallel to quartz-tourmaline veining. This reaffirms the structural affinities of the mineralisation and North Cashbolt and indicates that a high grade zone within the broader low grade alteration zone may exist, but remains poorly defined by the low spatial density of sampling to date. Figure 7 shows the results of North Cashbolt mapping and sampling to date.

Another consideration is the potential depth extent of Sn-mineralisation. While veins at North Cashbolt were very thin (millimetres), it was possible to follow some along intermittent outcrop over the course of several meters. The veins variably trend N to NE and have an average dip of 73^0. There is potential for high grade mineralisation that is localised at surface to extend to significant depth.

It is recommended that an auger sampling program be conducted at North Cashbolt to provide assay results of *in situ* material at regular, closely spaced intervals to establish whether the high grade zones are of sufficient extent to warrant drill testing. Sampling is recommended on 25 m intervals along 200 – 350m long lines spaced 50 m apart perpendicular to the trend of the tourmalinised zone, with a more detailed grid of 5 by 5m sampling over the 50 by 100 m area defined by high grade rock samples near the southern end of the tourmalinised zone as shown in Figure 7.

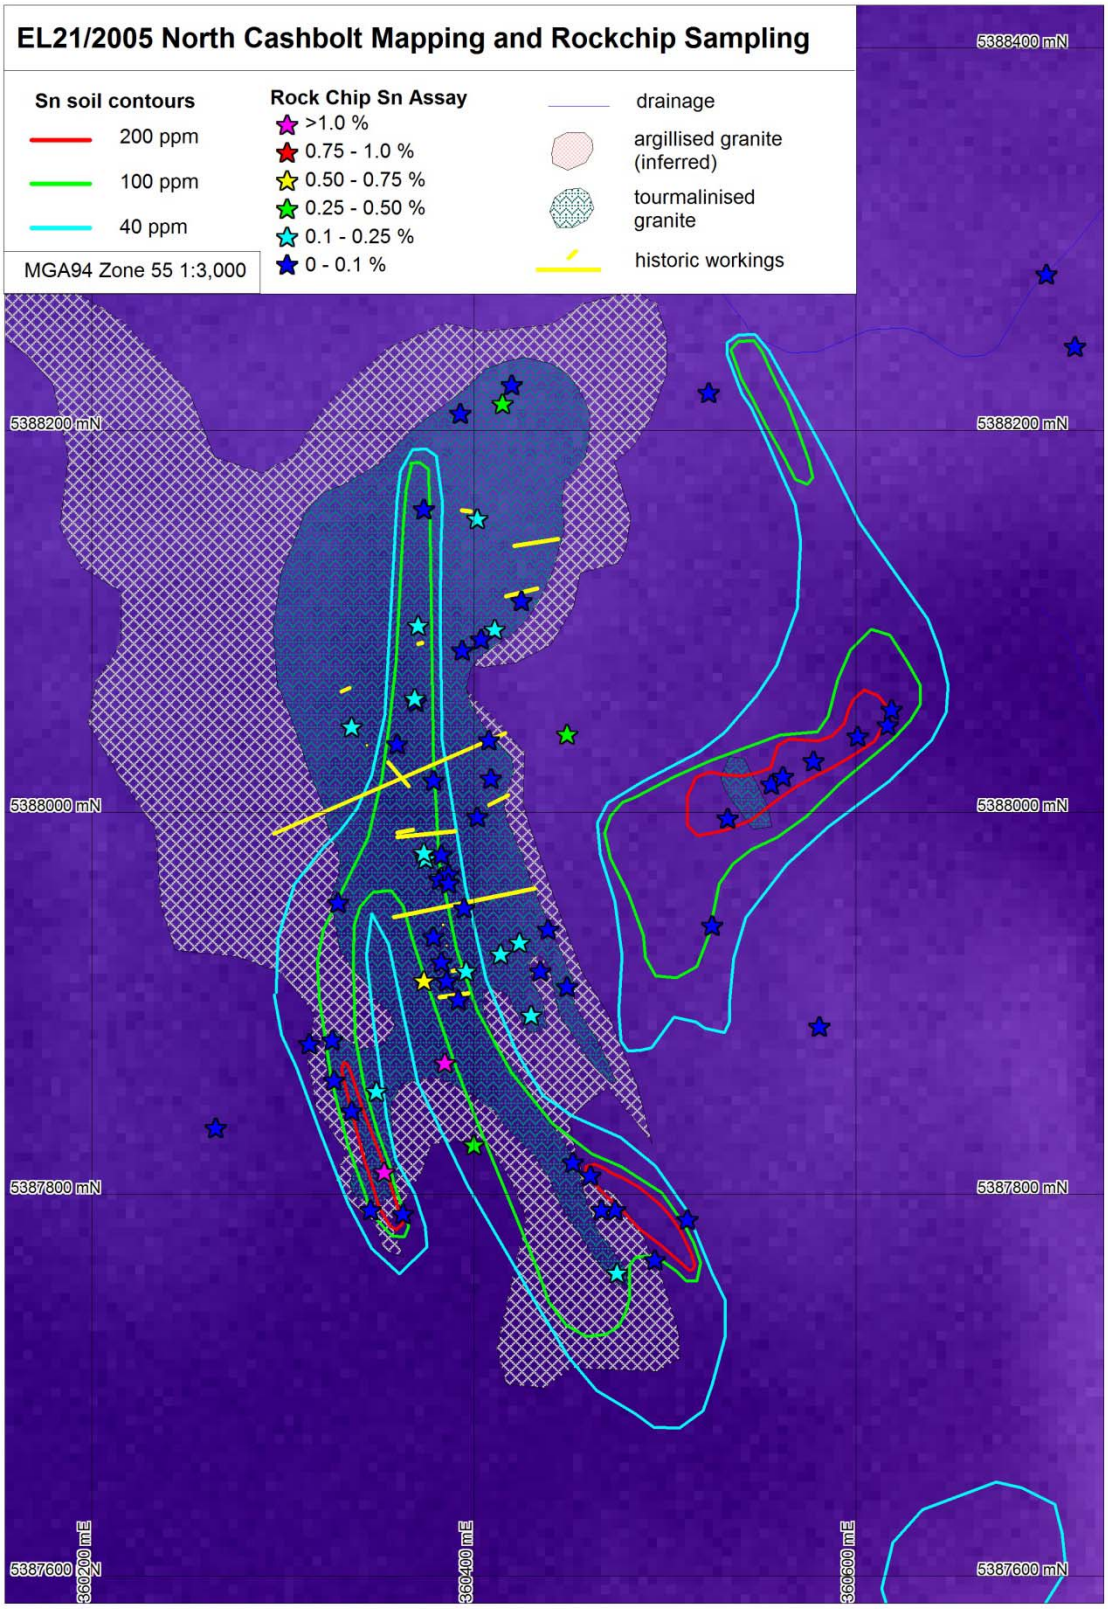

Figure 7: Venture's North Cashbolt mapping and rockchip sampling, showing the location of old workings over quartz-tourmalinised granite.

6.3 Salmons Creek Target

The Salmons Creek target is a curved magnetic anomaly coincident with the folded boundary between the Success Creek Group and the Crimson Creek Formation approx. 2 km southwest of the Mt Lindsay Main and No.2 skarns (Figure 2). The sealed Pieman Road and several gravel tracks cut across the Salmons Creek target area. Previous work in included two drill holes by Renison in 1975, and reconnaissance mapping and rock sampling by Venture indicate the presence of highly pyritic siltstones, dolomite, minor pyroxene microskarn and localised magnetite mineralisation within the Red Rock Member. The Stanley Dolomite, host to the Livingstone and Reward deposits c. 2 km to the northwest, is the main target unit.

During 2012 – 2013 some 454 hand-auger soil samples were collected over the magnetic anomaly at Salmons Creek. The is no significant W anomalism and while Sn reaches 500 ppm the anomalism is spotty and largely incoherent (Figure 8). The soil sampling confirms the view that there is little chance of near surface Sn and W mineralisation and most of the observed geochemical trends are stratigraphic (Figures 9 - 11).

The Crimson Creek Formation, as elsewhere, is the most geochemically distinct unit at Salmons Creek, containing elevated Fe, Cu, Co, Cr, Ti & V, as well as weakly elevated Ga & Ni, and variable Li and Sb. Adjacent to this unit is a thin sliver of the Red Rock Member of the Success Creek group which has variable geochemistry; interpretation is difficult due to possible local thickening and thinning (perhaps even pinching out) of the unit covered by a comparatively low spatial density of soils samples. The Stanley Dolomite is very poorly exposed but appears to be geochemically distinguishable at Salmons Creek being depleted in most elements in comparison to the adjacent Red Rock Member and Dalcoath Formation. Particularly noticeable among these are Hf, Nb, Rb, Ta, Th, U and Zr, and the low levels of these elements delineates a curved trend in the soil data of similar orientation to the magnetic anomaly and consistent with the medium scale folding observed in the area. The Dalcoath Formation has highly variable geochemistry that distinguishes it relatively well from the neighbouring more uniformly low-level Stanley Dolomite.

There is a coincident As, B and Mo anomaly in the northwest of the Salmons Creek area that appears to crosscut stratigraphy (see Figures 12 - 14). Prospecting of the area found evidence of brecciation, silcification and minor quartz-carbonate veining, and it is possible the geochemical anomaly is associated with a cross cutting fault zone. Elevated boron is associated with the Meredith Granite which outcrops c. 1.8 km to the northwest, and the B+As+Mo anomaly may indicate the presence of blind or poorly exposed granitic dykes and/or quartz-tourmaline veins. Further mapping is recommended to investigate the anomaly.

Spotty but co-incident Sn, Cu, Pb and B anomalism is also noted over a magnetic high immediately south of the As+B+Mo anomaly and further work is recommended focussing on the identification of distal skarn and greisen geochemical indicators, geological mapping and structural modelling to define targets in the 100-300 m subsurface range for drill testing.

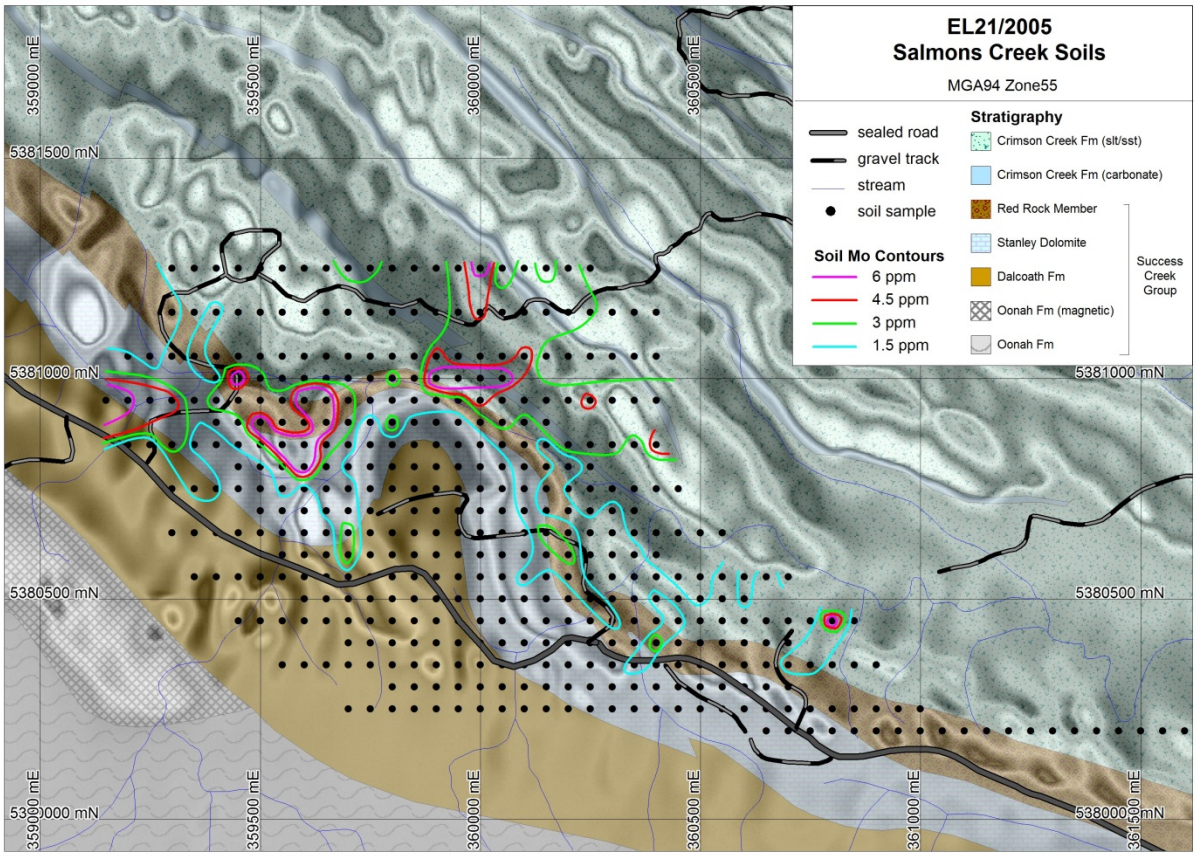

Figure 14: Salmons Creek Mo soil contours overlaid on regional aeromagnetic imagery and basement geology.

6.4 Upper Harman Target

Some 29 soil samples were collected in the Upper Harman area, as part of a larger sampling program conducted predominantly in Venture's adjacent Exploration Licence 45/2010. Soil samples were collected at c. 20 m intervals along 10 east northeast trending lines approx. 180 m apart. The upper Harman River flats are extensively covered with a thin veneer of largely locally derived lateritic and granitic gravels and results from alluvial areas are rejected as transported. Three northwest trending moderately Sn anomalous zones (up to 187ppm) are outlined and thought to be essentially in situ, extending from the margin of the Meredith Granite into the Wilson River Ultramafic Complex ("WRUC") (Figure 15). The north western Sn anomaly is also associated with higher levels of Rb and Be and located close to a small WO_3 anomaly (up to 441 ppm) at the granite contact. The weak Rb anomalism could reflect presence of a granite dyke a depth, a potential conduit for fluids, and the north westerly trend to the Sn anomalism is essentially parallel to cassiterite-bearing vein orientations observed at the nearby Big Wilson and North Cashbolt Sn prospects: A north west striking vein and greisen system may be present immediately beneath ultramafics in the upper Harman area.

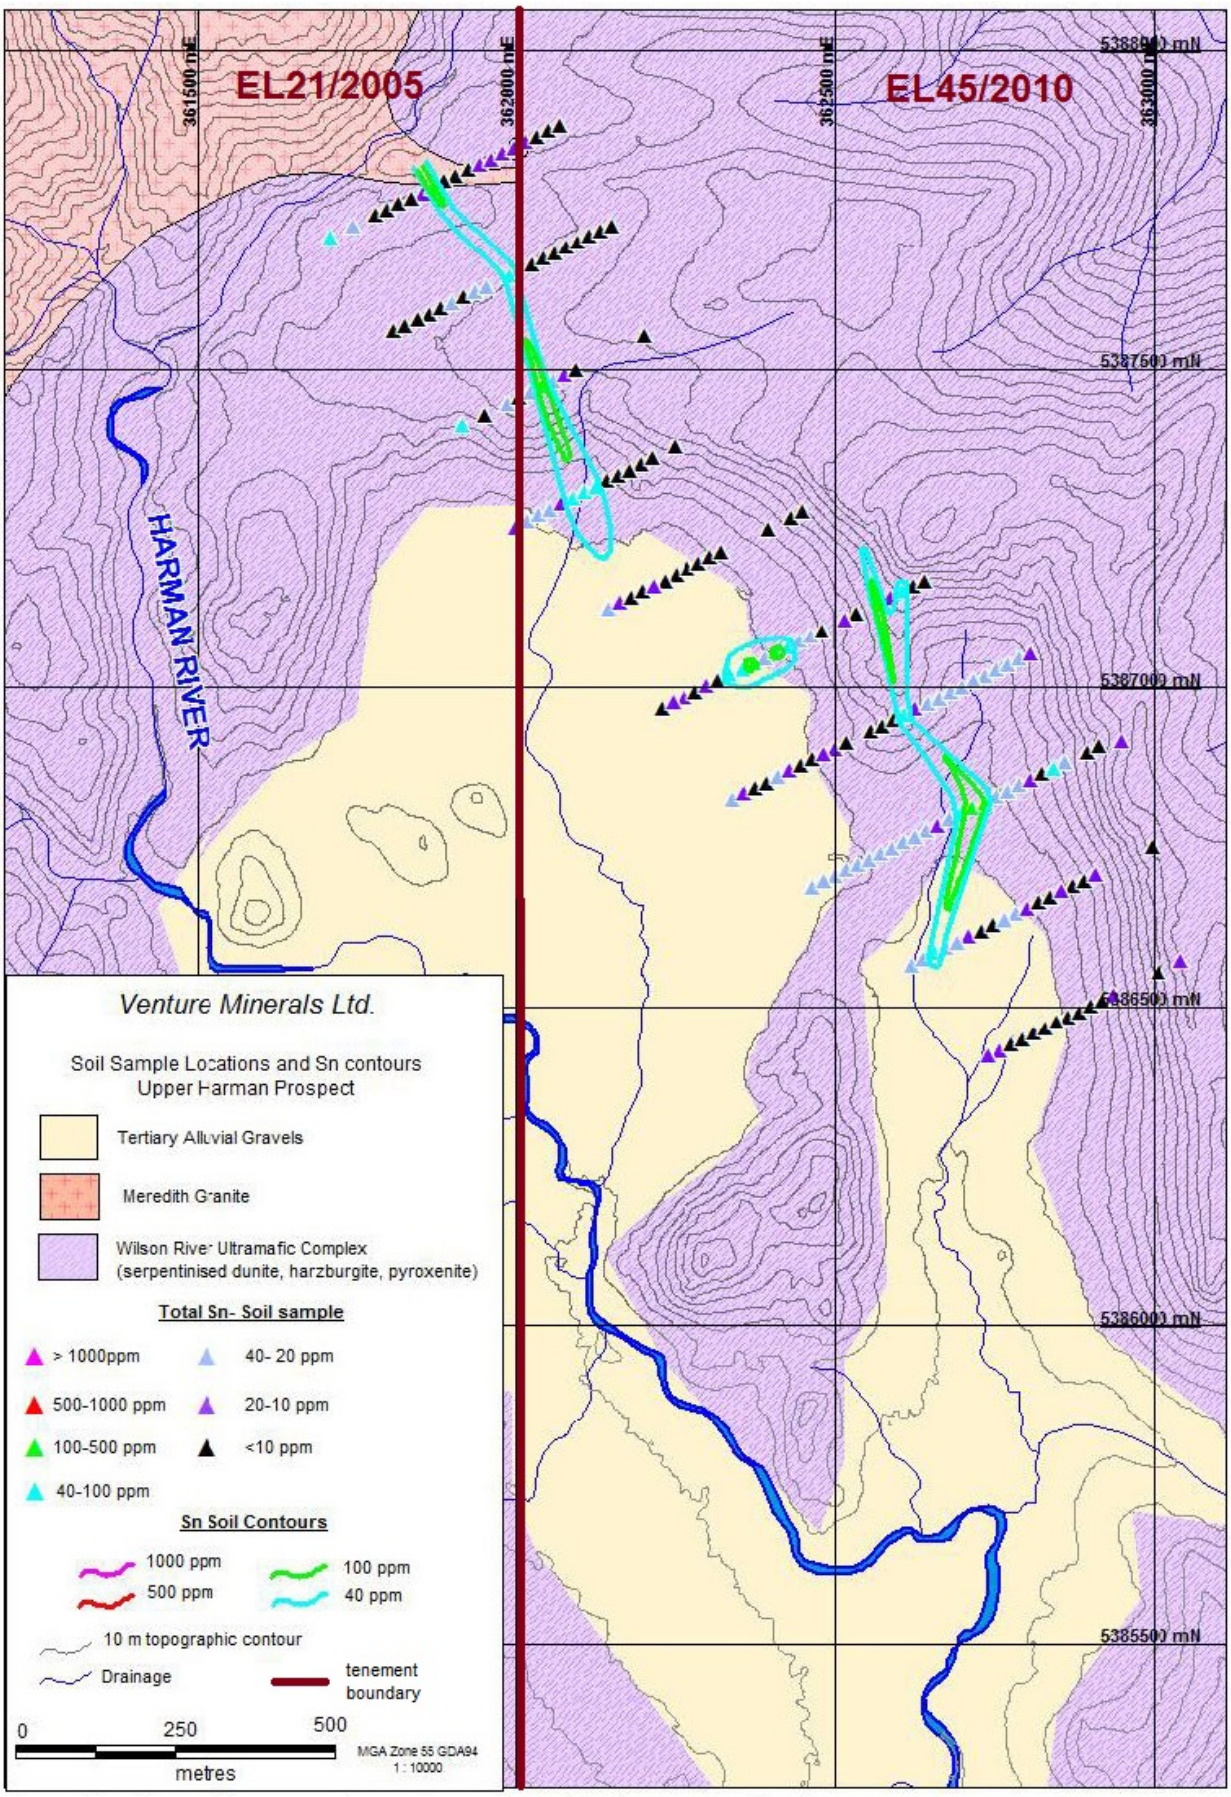

Figure 15: Upper Harman soil samples coloured and contoured by Sn ppm

7 Conclusions and Recommendations

EL21/2005 currently includes two magnetite-tin-tungsten resources, namely the Mt Lindsay Main and No.2 greisenised skarns or deposits, and several advanced skarn and greisen prospects including the No.1, Waterhouse, Eastern and Webbs Creek greisenised skarns and the North Cashbolt greisen. The Livingstone and Reward tin-tungsten-magnetite and DSO resources formerly within EL21/2005 have now been excised into Mining Lease 3M/2012 held by Venture Minerals. Venture has also made application to MRT for a Mining Lease covering the Mt Lindsay Main and No.2 deposits plus area for associated plant, infrastructure, tailings and wall rock storage which is also expected to be excised from EL21/2005 upon grant. Current combined resources for the Main, No.2 and Reward skarns at a 0.2% SnEQ cut-off are 41 Mt at 0.4% SnEQ (0.2% Sn, 0.1% WO3 and 18% Magnetic Recovery), including 11 Mt at 0.7% SnEQ (0.3% Sn, 0.2% WO3 and 17% Magnetic Recovery) using a 0.45% SnEQ cut-off.

Activities within EL21/2005 were focussed on the completion of a Bankable Feasibility Study (BFS) into the development of the Mt Lindsay Main, Mt Lindsay No.2 and Reward tin-tungsten-magnetite deposits, and included completion of core logging and assaying, resource modelling, extensive metallurgical test work, geotechnical and hydrogeological assessment and modelling, resource estimation, mining studies, process design, environmental studies and financial modelling of bankable standard. The BFS confirms the long-term, high-value potential of the project. Highlights include:

- 14mt Maiden Reserve including proved reserves of 6.4mt @ 0.7% tin equivalent
- Project generates in excess of AU$550 million in net revenue (pre tax)
- Net annual revenue peaks at more than AU$110 million (pre tax)
- Long mine life of 9 years
- NPV AU$143 million
- Return on Equity: 33% (60%debt/40%equity)
- Payback period of 4 years
- Capital cost of AU$198 million including a 35% plant capacity upgrade to 1.75mtpa.
- Mt Lindsay BFS excludes the Company's near-term cash flow Direct Shipping Ore ("DSO") Projects.

Resource and metallurgical reports associated with the BFS work are included in appendices J and K, the relevant hydrological, geotechnical, mining, environmental and financial reports will submitted in next year's annual report.

Exploration activities during 2012-2013 within EL21/2005 were focussed on the North Cashbolt, Upper Harman and Salmons Creek areas where a total of 450 soil samples and 47 rock samples were collected and assayed. An analysis of Venture's entire Mt Lindsay Project soil geochemistry data set was also carried out to characterise basement lithology signatures, refine interpretation of the basement geology and enhance the recognition of geochemical signatures associated with skarn and greisen mineralisation. The discovery of 1 to 5 Mt of additional high grade (>0.7%) Sn and/or W mineralisation in the vicinity of the known resources within EL21/2005 would enhance project economics and further exploration and assessment of the many identified prospects continues. It is recommended

that further exploration activities be focussed on the work on the No.1, Waterhouse and Eastern skarns, the North Cashbolt greisen and the Salmons Creek skarn target.

EL21/2005 Rock sample locations and assays 22/8/2012 to 21/8/2013

Appendix B: EL21/2005 Rock Sample Locations and Assays 22/8/2012 to 21/8/2013

H0002	Version	3								
H0003	Date_generated	21/8/2013								
H0004	Reporting_period_end_date	21/8/2013								
H0005	State	TAS								
H0100	Tenement	EL21/2005								
H0101	Tenement_holder	Venture Minerals Ltd								
H0102	Project_name	Mt Lindsay								
H0106	Tenement_operator	Venture Minerals Ltd								
H0150	250K_map_sheet	SK5503 Burnie								
H0151	100K_map_sheet	7914 Pieman								
H0152	50K_map_sheet	na								
H0153	25K_map_sheet	3437 Stringer, 3438 Livingstone, 3637 Rosebury, 3638 Parsons, 3639 Ramsay								
H0200	Start_date_of_data_acquisition	22/8/2012								
H0201	End_date_of_data_acquisition	21/8/2013								
H0202	Data_format	SG3								
H0203	Number_of_data_records	47								
H0204	Date_of_metadata_update	21/8/2013								
H0500	Feature_Located	Sample Point								
H0501	Geodetic_datum	GDA94								
H0502	Vertical_datum	not applicable								
H0503	Projection	MGA								
H0531	Projection_zone	55								
H0532	Surveying_instrument	GPS Garmin62CSx or MAP								
H0533	Surveying_Company	Venture Minerals Ltd								
H0600	Sample_code	ROCK								
H0601	Sample_type	outcrop								
H0602	Sample_description	see data								
H0700	Sample_preparation_code	PREP-21								
H0701	Sample_preparation_details	dry, crush, LM5 pulverise to approx P80 <75 microns								
H0702	Job_no	see data								
H0800	Assay_code	MS62,ICP69,XRF05								
H0801	Assay_company	ALS Global, samples prepared in Adelaide lab, assayed in Perth & Brisbane labs								
H0802	Assay_description	Sn by XRF on pressed powder disks (XRF05), B by nitric and hydrofluoric acid digest at ~200°C digest with ICP finish (B-ICP69), all other elements by HNO3-HClO4-HF-HCl digestion with ICP finish (ME-ICP61).								
H0900	Remarks:	-999 designates no assay, -1111 designates assay above upper limit of detection								
H1000	Sample	Prospect	E_MGA55	N_MGA55	Lith	Description	Magsus	Ascheme	Batch	Date

D	NCCR004	North Cashbolt	360420	5388224	ZQT	0.5m continuous rock-chip sample trending 245^0, ~perpendicular to tu-veins	3.27	ALS-ICP61XRF15b	AD13085863	3/06/2013
D	NCCR005	North Cashbolt	360415	5388214	ZQT	0.5m continuous rock-chip sample toward 245^0 intersecting criss-crossing tu-veins <1-2mm thick	1.99	ALS-ICP61XRF15b	AD13085863	3/06/2013
D	NCCR006	North Cashbolt	360393	5388209	ZQT	~0.15m spot rock-chip sample from small, nonveined ZQT boulder bearing minor Fe-staining + flecks	2.51	ALS-ICP61XRF15b	AD13085863	3/06/2013
D	NCCR011	North Cashbolt	360394	5388085	ZQT	0.3m continuous hammer-chipped sample trneding 180^0, ~perpendicular to sheeted ≤1mm tu veinlets	1.52	ALS-ICP61XRF15b	AD13085863	3/06/2013
D	NCCR013	North Cashbolt	360404	5388091	ZQT	0.25m sample trending 193^0, ~perpendicular to and including a ~15mm thick dgn tu vein	1.16	ALS-ICP61XRF15b	AD13085863	3/06/2013
D	NCCR014	North Cashbolt	360411	5388096	ZQT	0.9m continuous hammer-chipped sample trending 220^0, ~perpendicular to gn tu-veining	2.78	ALS-ICP61XRF15b	AD13085863	3/06/2013
D	NCCR016	North Cashbolt	360425	5388111	ZQT	spot rock-chip sample of icg ZQT boulder. No veins.	2.85	ALS-ICP61XRF15b	AD13085863	3/06/2013
D	NCCR017	North Cashbolt	360329	5387953	ZQT	0.2m hammer-chipped sample trending 036^0 through icg qz-dominated ZQT w/ no veins.	2.14	ALS-ICP61ICP69XRF05	AD13049052	8/04/2013
D	NCCR019	North Cashbolt	360375	5387976	ZQT	0.15m hammer-chipped sample trending 082^0 across gn tu veins/joints	0.93	ALS-ICP61ICP69XRF05	AD13049052	8/04/2013
D	NCCR020	North Cashbolt	360383	5387978	ZQT	spot rock-chip sample of one of several sub-30cm2 boulders of icg ZQT poorly exposed in swampy buttongrass.	1.07	ALS-ICP61ICP69XRF05	AD13049052	8/04/2013
D	NCCR022	North Cashbolt	360402	5387998	ZQT	0.8m continuous rock-chip sample trending 059^0 across sheeted tu veins ≤1-20mm thick in dgn-bl ZQT.	2.89	ALS-ICP61XRF15b	AD13085863	3/06/2013
D	NCCR031	North Cashbolt	360374	5387912	ZQT	0.2m continuous hammer-chipped sample trending ~160^0, perpendicular to and including thin tu vein in small ~0.3x0.2m outcrop	0.59	ALS-ICP61ICP69XRF05XRF15b	AD13049052	8/04/2013
D	NCCR032	North Cashbolt	360396	5387917	ZQT	0.3m continuous sample perpendicular to planar fabric and veining in icg ZQT boulder; chipped along sharp jointed edge of boulder	0.77	ALS-ICP61ICP69XRF05	AD13049052	8/04/2013
D	NCCR033	North Cashbolt	360414	5387926	ZQT	0.3m continuous sample trending 066^0 through icg ZQT bering repeating ~1mm thick tu veinlets (trending 340^0)	1.62	ALS-ICP61XRF15b	AD13085863	3/06/2013
D	NCCR035	North Cashbolt	360424	5387932	ZQT	0.7m continuous rock-chip sample trending ~117^0, ~perpendicular to weakly anastamosing dgn-bk ifg-img tu veining in icg ZQT	1.53	ALS-ICP61XRF15b	AD13085863	3/06/2013
D	NCCR037	North Cashbolt	360439	5387939	ZQT	0.5m continuous hammer-chipped sample parallel to joints (trend 350^0), cross cutting tu-veins in icg ZQT. Does not intercept ivcg tu-lense.	2.36	ALS-ICP61XRF15b	AD13085863	3/06/2013

Appendix B: EL21/2005 Rock Sample Locations and Assays 22/8/2012 to 21/8/2013

H1000	Sample	Prospect	E_MGA55	N_MGA55	Lith	Description	Magsus	Ascheme	Batch	Date
H1001			metres	metres			1x10-3 SI units			
H1002			10	10						
D	NCCR041	North Cashbolt	360533	5387997	FG	1.9m continuous rock-chip sample trending 076^0 across top of icg, ppy fp FG boulder	0.83	ALS-ICP61ICP69XRF05	AD13049052	8/04/2013
D	NCCR042	North Cashbolt	360556	5388015	ZQT	composite spot rock-chip sample of several ZQT boulders, including some bearing 2-3mm thick sheeted tu veins	1.37	ALS-ICP61ICP69XRF05	AD13049052	8/04/2013
D	NCCR043	North Cashbolt	360562	5388019	FG	0.6m continuous rock-chip sample trending 065^0 and crossing one joint (347/79W); double-width to increase sample volume. ZQT boulder float not sampled.	0.57	ALS-ICP61ICP69XRF05	AD13049052	8/04/2013
D	NCCR045	North Cashbolt	360578	5388027	FG	0.7m continuous rock-chip sample trneding 058^0 through homogeneous icg FG w/ minor ppy fp	0.54	ALS-ICP61ICP69XRF05	AD13049052	8/04/2013
D	NCCR047	North Cashbolt	360601	5388040	FG	1.1m continuous rock-chip sample trending 257^0 through icg FG w/ diffuse img tu-alt banding & minor nodules	0.75	ALS-ICP61ICP69XRF05	AD13049052	8/04/2013
D	NCCR048	North Cashbolt	360617	5388046	FG	2.3m continuous rock-chip sample trending 081^0, intersecting one significant tu vein	0.86	ALS-ICP61ICP69XRF05	AD13049052	8/04/2013
D	NCCR049	North Cashbolt	360619	5388054	FG	spot rock-chip sample; 1/2 tu-alt nodule & 1/2 comparatively unaltered FG	1.18	ALS-ICP61ICP69XRF05	AD13049052	8/04/2013
D	NCCR054	North Cashbolt	360523	5388220	ZQT	spot rock-chip sample of gn tu ZQT float	0.5	ALS-ICP61XRF15b	AD13085863	3/06/2013
D	NCCR057	North Cashbolt	360360	5388036	ZQT	spot rock-chip sample of tu-veined icg ZQT boulder from old trench spoil pile	1.02	ALS-ICP61ICP69XRF05	AD13049052	8/04/2013
D	NCCR058	North Cashbolt	360349	5387854	ZQT	composite rock-chip sample of 3 boulders amongst angular ZQT boulder float	5.01	ALS-ICP61ICP69XRF05	AD13049052	8/04/2013
D	NCCR059	North Cashbolt	360385	5387869	ZQT	spot rock-chip sample of small ww ZQT composed if icg qz,ifg-img gn tu→?cl & trace lyw-gn flecks	3.75	ALS-ICP61ICP69XRF05XRF15b	AD13049052	8/04/2013
D	NCCR060	North Cashbolt	360430	5387894	ZQT	0.8m continuous hammer-chipped sample trending ~035^0 perpendicular to 1-3mm gn tu sheeted veins in gn tu ZQT	0.58	ALS-ICP61XRF15b	AD13085863	3/06/2013
D	NCCR061	North Cashbolt	360435	5387917	FG	1.35m continuous rock-chip sample (except for 0.1m obscured by soil and organics--weathered joint?) crossing 2 major tu veins and several minor ones in icg FG	0.35	ALS-ICP61XRF15b	AD13085863	3/06/2013
D	NCCR062	North Cashbolt	360449	5387909	ZQT	0.3m continuous rock-chip sample through ZQT boulder & intersecting thin anastamosing ifg gn tu veins bearing minor Fe-staining + minor lbn grains? Not the alrgest boulder exposed, but most likely to be in situ?	1.43	ALS-ICP61XRF15b	AD13085863	3/06/2013
D	NCCR066	North Cashbolt	360525	5387941	FG	1.4m continuous rock-chip sample trending 072^0, approx. perpendicular to & including thin tu vein	1.38	ALS-ICP61ICP69XRF05	AD13049052	8/04/2013
D	NCCR069	North Cashbolt	360571	5387958	tuV	spot sample of mixed ifg dbl-bk tu & icg bk-bn tu vein in weakly tu-alt FG	1.79	ALS-ICP61XRF15b	AD13085863	3/06/2013
D	NCCR073V	North Cashbolt	360581	5387888	tuV	composite subsample of 3 large tu-alt veins in icg FG outcrop	0.57	ALS-ICP61XRF15b	AD13085863	3/06/2013
D	NCCR075	North Cashbolt	360512	5387787	FG	0.95m continuous rock-chip sample trending 277^0 through icg FG w/ minor tu-qz alt nodules. (Start of sampling line)	0.62	ALS-ICP61ICP69XRF05	AD13049052	8/04/2013
D	NCCR076	North Cashbolt	360495	5387766	FG	hammer-chipped sample through ~0.3m platy icg FG boulder thickness, ~perpendicular to single tu vein	0.69	ALS-ICP61ICP69XRF05	AD13049052	8/04/2013
D	NCCR077	North Cashbolt	360475	5387759	ZQT	spot rock-chip sample of small ZQT float boulder	1.19	ALS-ICP61ICP69XRF05	AD13049052	8/04/2013
D	NCCR081	North Cashbolt	360474	5387792	FG	spot rock-chip sample of tu-alt FG float; close to being in situ?	1.18	ALS-ICP61ICP69XRF05	AD13049052	8/04/2013
D	NCCR082	North Cashbolt	360467	5387792	FG	0.3m continuous rock-chip sample trending 256^0, ~ perpendicular to vein in icg FG boulder outcrop	0.54	ALS-ICP61ICP69XRF05	AD13049052	8/04/2013
D	NCCR083	North Cashbolt	360461	5387810	FG	1.1 continuous rock-chip sample trending 086^0 through icg FG outcrop and including two tu veins, one of each orientation	0.55	ALS-ICP61ICP69XRF05	AD13049052	8/04/2013
D	NCCR084	North Cashbolt	360452	5387817	ZQT	0.4m continuous rock-chip sample trending ~257^0, ~perpendicular to sheeted tu veins & incorporating ~5cm of vein material in total	2.46	ALS-ICP61ICP69XRF05	AD13049052	8/04/2013
D	NCCR085	North Cashbolt	360326	5387881	ZQT	0.4m continuous rock-chip sample trending 060^0, ~perpendicular to and intersecting anastamosing sheeted tu veins	1.75	ALS-ICP61ICP69XRF05	AD13049052	8/04/2013
D	NCCR086	North Cashbolt	360327	5387860	ZQT	spot rock-chip sample of small ~0.25x0.15m exposure of ifg-img tu + icg qz ZQT	3.32	ALS-ICP61ICP69XRF05	AD13049052	8/04/2013
D	NCCR087	North Cashbolt	360336	5387844	ZQT	0.6m hammer-chipped sample trending ~235^0, perpendicular to ~0.25m wide partially eroded tu-alt lense	1.3	ALS-ICP61ICP69XRF05	AD13049052	8/04/2013
D	NCCR089	North Cashbolt	360346	5387792	FG	1.1m continuous rock-chip sample trending 094^0 through minor tu-veined icg FG bearing several ifg enclaves	0.64	ALS-ICP61ICP69XRF05	AD13049052	8/04/2013
D	NCCR090	North Cashbolt	360363	5387790	FG	spot rock-chip sample of icg ppy fp FG w/ minor tu nodules and ifg enclaves.	1.32	ALS-ICP61ICP69XRF05	AD13049052	8/04/2013

Venture Minerals Lithologic Codes

Code	Description	Code	Description	Code	Description
Regolith					
R	undifferentiated regolith	RL	undifferentiated laterite	RCLY	in situ clay
RCAC	calcrete	RLG	lateritic gravel	RSAP	undifferentiated saprolite
RSIC	silcrete	RLI	in situ laterite	RGOS	gossan ("iron cap"); textural or mineral prefix as appropriate
RFEC	ferricrete	RLT	transported laterite		
Unconsolidated Sediments		**Breccias, Faults and Shear Rocks**		**No Recovery & Cavities**	
S	undifferentiated sediment	XHB	hydrothermal breccia	NCAV	cavity
SLG	lateritic gravel	XMYL	mylonite	NREC	no sample recovery
SGVL	unconsolidated gravel	XFB	Fault breccia - incohesive >30% clastic	NSAV	sample no longer available
SPCS	unconsolidated pebbly/cobbly sand			NCTM	contaminationed interval
SAND	unconsolidated sand	XFG	Fault gouge - incohesive <30% clastic		
SILT	unconsolidated silt			**Veins**	
SMUD	unconsolidated mud	XFC	Fault cataclasite - cohesive more than >30% clastic		
SCLY	unconsolidated clay (transported)			*V	Veins, ≤2 mineral prefixes
cyRB	regolith breccia with clay matrix			*VB	Vein breccia, ≤2 cement prefixes
Sedimentary Rocks (S*)					
SS qzSS volcSS lithSS ccSS	>75% sandstone (undifferentiated) over minimum 5m logging interval, prefixes qz = quartz, lith = lithic, volc = volcanogenic, cc = calcareous	SMP	phyllite	SCB, ooSCB, stSCB, bcSCB	undifferentiated carbonate, prefixes oo=oolitic, st=stromatolitic, bc=bioclastic
		SGRT	grit		
		SSPC	pebbly or cobbly sandstone		
		SSIC	intraclastic SS & SCG	SLST	limestone
SM	>75% mudstone over ≥5m	SCG	conglomerate	SDOL	dolomite
ST	>75% siltstone over ≥5m	SCGR	mud chip conglomerate (rip-ups)	SCHT	chert
SSM	25-75% SS & SM over ≥5m	SCGM	monomict conglomerate	SBIF	banded iron formation
SST	25-75% SS & ST over ≥5m	SCGP	polymict conglomerate	SLIG	lignite
SMH	shale	SBRM	monomict breccia	STIL	tillite
SML	slate	SBRP	polymict breccia	STUF	tuffite (redeposited)
SMA	argillite			SLAP	redeposited lapilli-stone
Igneous Rocks (U* for Ultramafic, M* for Mafic, I* for Intermediate, F* for Felsic)					
UM	undifferentiated ultramafic	UKoMC	olivine mesocumulate; komatiite flow	ID	diorite
UDUN	dunite			F	undifferentiated felsic rock
UHAR	harzburgite	MG	gabbro	FG	undifferentiated granitoid
UPX	pyroxenite	MGL	leucogabbro	FGRA	granite
USERP	serpentinite	MD	dolerite	FGRD	granodiorite
UKIM	kimberlite	MB	basalt	FDIO	diorite
ULAP	lamproite	MBHM	high-magnesium basalt	FMOZ	monzonite
ULAY	ultramafic lamprophyre	MBP	pillow-basalt	FSYE	syenite
UK	komatiite (undifferentiated)	MBHY	basaltic hyaloclastite	FTUF	felsic tuff
UKSTX	spinifex textured; komatiite flow	MLAP	mafic lapilli-stone	FV	undifferentiated felsic volcanic rock
UKoOC	olivine orthocumulate; komatiite flow	MTUF	mafic tuff		
		IA	andesite	FRHY	rhyolite
				FDAC	dacite
Metamorphic & Metasomatic Rocks (Z*)					
ZSCH	undifferentiated schist	ZMRB doMRB	marble, >50% cb; ≤1 key mineral prefix	mtZXS	>50%) magnetite; matrix replacement to massive bands. <am, po & cb. Grn, or aci after vo.
mZSCH	undifferentiated mafic schist; >am, cl &/or bt; <fp, qz, lx etc...	gtZXS	pbl gt in px+cc matrix (<10% px = gtZMRB) ± minor matrix am, mt, po etc. gt→ve; gradational with veZXS	voZXS	>50% vonsenite; aci, radiating
fZSCH	undifferentiated felsic schist; >qz, fp, mu; <mafic minerals			poZXS	>50% pyrrhotite; bnd, semi-mas to mas
btZSCH	use mineral code prefixes for only the distinguishing minerals	veZXS	tab, pbl, & orb ve in px-cc matrix.		
ZGNS	undifferentiated gneiss	olZXS	>50% grn ol; ± ol→sr, hrn, dis mt, patches wt-lgn px.	pyZXS	>50% pyrite; semi-mas to mas
btZGNS ksp-ZGNS	bt-gneiss, K-fp-gneiss, etc… using mineral code prefixes for only the distinguishing minerals	lpZXS	leopard skarn = olZXS w/ irregular granitic blobs/dyklets→px, rimmed by pk gt, lgn px, gn ph.	sdZXS	>25% siderite; includes sqp & s+p, <cs + ksp
				btZXS	>50% biotite; bn-bk, "books" common ± fl
ZAMP	undifferentiated amphibolite				
ZHF	hornfels, ifg; ≤2 mineral prefixes as appropriate (eg. muZHF, andZHF)	amZXS	>50% amphibole; mas felted bands &/or pseudomorphs of pbl gt. <cb, mt, po, vo.	srZXS	>50% serpentine; mas translucent to flakey lgn-dgn, after olZXS.
amZHF	amphibole (>20%) hornfels			ZGRS	Undifferentiated greisen; saccharoidal qz-mu aggregate. Ppy fp→po.
btZHF	biotite (>20%) hornfels; brownish, brown streak	am-voZXS	amphibole (25-50%) + vonsenite (25-50%); vo often radiating aci between am &/or ve after pbl gt.		
pxZHF	pyroxene (>20%) hornfels; whitish to whitish-green			ZQT	tourmaline "greisen" = FGRA w/ ppy fp→tu, saccharoidal qz groundmass ± ifg mu.
axZHF	axinite (>20%) hornfels; purplish	ammt-ZXS	amphibole (25-50%) + magnetite (25-50%); typically matrix around ex-gt pbl		
qzZHF	quartz (>20%) hornfels; hard, bronze-grey, microcrystalline qz w/ po, black streak				
		ampo-ZXS	amphibole (25-50%) + pyrrhotite (25-50%); pbl		

Venture Minerals Mineral and Textural Codes

cd	cordierite	gr	graphitic	mu	muscovite				
Pseudomorphs		**Sedimentary Bedding**		**Sedimentary Grain size**				**Igneous/Metamorphic Grain Size**	
gt→ve	gt replaced by ve	lam	laminated (<1cm)	svfg	very fine grained <64 um (mud, silt & clay)				
gt→am	gt replaced by am	tnb	thin (1-10cm)	sfg	fine grained 64 um to 0.25 mm (fine sand)			ifg	fine, <1mm
fp→tu	fp replaced by tu	mdb	medium (10-30cm)	smg	medium grained 0.25 to 0.5mm (medium sand)			img	medium, 1-5mm
fp→se	fp replaced by se	tkb	thick (>30cm)	scg	coarse grained 0.5 to 2 mm (coarse sand)			icg	coarse, 5-30mm
fp→po	fp replaced by po	vtkb	very thick (>1m)	svcg	very coarse grain >2mm (2 - 4mm granules, 4 - 16mm pebbles, 16-256 mm cobbles, >256 mm boulders)			ipg	pegamatitic, >30mm
vo→mt	vo replaced by mt								
Textures								**Sample Recovery**	
aci	acicular	gph	graphic	pbl	porphyroblastic	spt	spotted	e	excessive
amg	amygdaloidal	grn	granular	pcl	porphyroclastic	sqp	qz prisms in sd	g	good
anh	anhedral	gtp	(ex)garnet pbl	ppy	porphyritic	stwk	stockwork	m	moderate
bdn	boudins	lam	laminated	psm	prismatic	sub	subhedral	p	poor
bnd	banded	mas	massive	rcz	recrystalised	tab	tabular	n	none
bxw	boxwork	mot	mottled	ruc	rip-up clasts	tad	am±po tailed spots		
col	cauliflower texture	mta	acicular magnetite	sch	schistose	tuf	tuffaceous	**Moisture**	
den	dendritic	mtg	granular magnetite	scl	cleaved	ves	vesicular	S	Sloppy
dis	disseminated	mzn	mineral zoning	shz	shear/shearzone	vet	tabular ve	M	Moist
euh	euhedral	oph	ophitic	spk	speckled	wrg	wrigglite	D	Dry
fol	foliated	orb	orbicules	s+p	salt+pepper; mt-sd				
Colours		**Structures**		**Weathering**					
l-	light (eg. lgn)	bkn	broken by drilling	vw	very weathered, BOTH PRIMARY TEXTURE & MINERALOGY DESTROYED; no sulphide, dominant Fe & Al oxides &/or silica (eg. Laterite)				
d-	dark (eg. dgn)	brc	brecciated						
bk	black	flt	fault	mw	moderately weathered, PRIMARY TEXTURE REMAINS but MINERALOGY SECONDARY clays (eg. saprolite)				
bl	blue	frc	fracture zone						
bn	brown	ftz	fault or fault zone	ww	weakly weathered, MAINLY PRIMARY TEXTURE & MINERALOGY; minor clay, partly oxidised sulphide (eg. saprock & fresh rock with iron staining)				
bz	bronze (sulphides)	hbr	healed-breccia						
cm	cream	mcf	microfaults, <1cm	fr	fresh (compeletely primary texture & mineralogy without significant iron staining on				
gn	green	slk	slickensides						
gy	grey	ssf	small-scale faults, 1-10cm offset			**Description Shorthand**			
kk	khaki					SOI	"start of interval"		
og	orange	BCA	acute angle: core axis & bedding			EOI	"end of interval"		
ov	olive					TCA	"to core axis"		
pk	pink	SCA	acute angle: core axis & foliation			PDW	post-drilling weathering (used during relogging)		
pl	purple					RCON	interval has redrilled fragments and/or contamination		
rd	red	FCA	acute angle: core axis & fault			HCl-	HCl non-reactive		
wt	white					HCl+	HCl reactive

H0203	Number_of_data_records	9558														
H0204	Date_of_metadata_update	21/08/2013														
H0500	Feature_Located	Drill Sample Assay														
H0600	Sample_code	DRILL SAMPLE														
H0601	Sample_type	drill core & cuttings														
H0602	Sample_description	see Sample_scheme where BQ, NQ, HQ & PQ = drill core, PERC = rotary or percussion cuttings														
H0702	Job_no	see data														
H0800	Assay_code	as below														
H0801	Assay_company	SGS Renison lab (SGSR) & ALS Global sample preparation at Adelaide lab, assayed in Perth lab (ALS)														
H0802	Assay_description1	Sn, WO3, Fe, S, As, Cu, Pb & Zn at SGS Renison by XRF on pressed powder disks (method XRF75E)														
H0803	Assay_description2	LOI, Al, As, Ca, Cr, Cu, Fe, K, Mg, Mn, Na, P, Pb, Si, Ti, Zn at ALS Global by XRF on fused disks (ME-XRF12 & XRF15b)														
H0804	Assay_description3	Ag, Bi, Be, Co, Ni at ALS Global by HNO3-HClO4-HF-HCl digestion with ICP finish (ME-ICP61s)														
H0805	Assay_description4	B by ALS Global by nitric and hydrofluoric acid digest at ~200°C digest with ICP finish (B-ICP69)														
H0900	Remarks	-999 designates no assay, -1111 designates assay above upper limit of detection
