

# EL25/2008 Jericho Annual Report 2019

EL 25/2008 (Jericho)

September 2018 – September 2019

Tiger Coal Pty Ltd  
(ACN: 130 087 697)

Wholly owned subsidiary of:

Authors:  
Luke Marshall & Daniel Macri

Report Date: September 2019

# Abstract

The purpose of EL25/2008 is to locate an economically feasible coal mine.

No exploration works were conducted during the 2018 – 2019 licence period due to an inability to secure funding as result of extremely hard investment conditions for junior coal exploration companies globally. Perceived sovereign risk by potential foreign investors was a common theme as evidenced by the delayed approvals for Adani's Carmichael coal mine.

To satisfy the company's ongoing capital requirements, Energy Investments' parent company Midland Energy Pty Ltd has recently formed a US based affiliate company, Midland Energy America LLC and released a **Regulation D 506 (c)** compliant Private Placement Offering to fund Energy Investments' ongoing exploration and development expenditure requirements.

This is a regulated offering under United States Securities Laws to accredited investors. The USA was selected as the best location to raise capital due to its favorable laws for start-up and emerging companies as well as it being one of the largest sources of capital in the world, with less risk aversion than other markets. Details of the offering can be obtained at [www.midlandenergyamerica.com](http://www.midlandenergyamerica.com)

During the reporting period, Tiger Coal submitted an application to MRT for an "EDGI" grant. Although this application was refused, the company is currently reviewing the original proposed program and intends to resubmit an updated application.

Tiger Coal is expecting to submit works programs to MRT in the coming months for recommencement of exploration works on EL25/2008 in late spring/early summer.

# 1. Introduction

The operator's (Midlands Energy Pty Ltd) principal objective of exploration in the Jericho area is to delineate any coal seams within the near surface Triassic coal measures for the purpose of defining one or more resources suitable for open cut mining.

## 1.1 Report Datum

GDA94

## 1.2 Exploration Rationale

The aim of the current exploration program on EL 25/2008 (Jericho) is to quantify an economically viable JORC resource in the near surface Triassic coal measures.

## 1.3 Geological Setting

The geology of the area is dominated by the freshwater sequence of mudstones, sandstones and siltstones of the Upper Parmeener of the Triassic intruded by Jurassic Dolerite. Typically the Coal measures are found within a lithic sandstone sequence (dominantly within the grabens) that has been preserved in some areas by Jurassic dolerite capping. Structurally, the Jericho area (and surrounds) is dominated by a series of north to north-north-western troughs/grabens upwards of 50 by 1 kilometres in size and disrupted by numerous north-east trending faults.

## 1.4 Licence Information

### 1.4.1 Licence Number

EL25/2008

### 1.4.2 Licence Name

Jericho

### 1.4.3 Licence Location

The Licence covers the Jericho district, from Bowhill Rd west of Oatlands in the north, to Mudwalls Rd in the south. Please refer to Location Plan at **Figure 1**.

### 1.4.4 Reporting Period

18<sup>th</sup> September 2018 – 17<sup>th</sup> September 2019

### 1.4.5 Tenement Holder

Tiger Coal Pty Ltd

Figure 1 – Location Plan

## 2. Previous Work

### 2.1 Work Prior to Current Licence

A review of past exploration was completed in the 2012 Annual Report (Pemberton, 2012).

The following are notes from the report.

Modern exploration has only taken place since 1980 when Capricorn Mining Ltd was granted EL 28/1979. Capricorn conducted a regional exploration program over a wide area that included reconnaissance geology, remote sensing, structural interpretation and some drilling (reports: TCR80\_1513, TCR81\_1682 and TCR82\_1798).

CRA Exploration Pty Ltd conducted a program over three licences in the Oatlands-Jericho-Kempton area: EL18/1982, EL19/1982 and EL20/1982. CRA used LANDSAT imagery to identify the overall structural trend in the area and followed up with a percussion drilling program to identify if the graben structures were prospective for coal. While the results indicated coal was present, elements of complexity due to the highly faulted nature of the area and the frequent presence of dolerite intrusions were also identified (report TCR84\_2213).

The Department of Mines drilled a deep diamond hole in 1982 at Mount Vernon (Mount Vernon DDH1). Coal measures were intercepted; the most significant seam observed was 2.3m thick from 204.79m and surprisingly low in ash.

Cornwall coal Company NL was granted EL11/91 in 1991 to follow up on this hole with three rotary holes and two diamond holes in the area with limited success attributed to both dolerite intrusions and the nature of the faulting proximal to the coal measures (reports TCR92\_3378 and TCR93\_3491).

## 3. Exploration

### 3.1 Desktop Studies

No Desktop Studies were completed in 2018 - 2019

### 3.2 Regional Exploration Activities

No regional exploration was conducted in 2018 - 2019

### 3.3 Prospect-based Exploration Activities

No prospect-based exploration was conducted in 2018 - 2019

#### 3.3.2 Geology

No Geochemistry was conducted in 2018 – 2019

### 3.3.3 Geochemistry

No Geochemistry was conducted in 2018 – 2019

### 3.3.4 Geophysics

No Geophysics were conducted in 2018– 2019

### 3.3.5 Remote Sensing

No Remote Sensing was conducted in 2018 - 2019

### 3.3.6 Drilling

No Drilling was conducted in 2018 - 2019

### 3.3.7 Ore Reserves and Resources

No Reserve or Resource calculations were conducted in 2018 - 2019

### 3.3.8 3D Modelling

No 3D modelling was conducted in 2018 - 2019

## 4. Results

No Results were recorded for the 2018 - 2019 licence period

## 5. Conclusions

### 5.1 Conclusions

Conclusions cannot be formulated due to no exploration work having been conducted

### 5.2 Recommendations

Further exploration works are recommended to fully understand the resource geology of the area and to more accurately define the economic boundaries of the potential resource. Management is currently researching the merits of conducting a 2D seismic survey campaign in the coming year in an attempt to better understand the local geology and better define new targets for future drilling programs.

Tiger Coal's parent company is currently raising funds through a US based **Regulation D 506 (c)** Private Placement Offering. This will fund exploration on EL25/2008 for the coming two years with an increasing intensity of exploration.

Tiger Coal is expecting to submit works programs to MRT in the coming months for the recommencement of exploration on EL25/2008 in late spring/early summer. The company is currently finalising a works program of approximately 1,000m of Diamond and RC drilling in the Mt Vernon area targeting historical intersections of higher quality coals.

## 6. Environment

No environmental disturbance was created during the 2018 - 2019 period. To the company's best knowledge, all previous disturbances have been rehabilitated

## 7. Expenditure

Our minimum expenditure for the 2019 exploration year has been estimated at \$150,000 for a proposed drill campaign at Mt Vernon.

However, if the aforementioned capital raising is fully subscribed (\$10,000,000 USD) the company proposes to rapidly accelerate exploration with a "development focus".
