re S.P.L. 91

Dear Sir,

since our last report of 1st. June, further work has been undertaken in the extended licence area of S.P.L.91.

Area "C". (see plan)

Contractors Casey & Connors, using a Cat. D7 bulldozer, costeamed a ridge to the south of the Lune River. This ridge was proved to be of quartzite similar to the deposits located further north i.e. "C" deposit. The silica rock was found to be weathered and soft near the surface and mostly covered with about 6-8ft. of soil. Further bulldozing is to be undertaken using a ripper.

Area "B".

Ten drill holes were put down to a depth of 10ft. using air percussion drilling equipment on hire from the Forestry Comm'n. These holes were fired with explosive in order to obtain deeper samples. The rock was found to become harder at depth, and will be sampled by a geologist after bulldozing and ripping.

Area "D".

Drill holes to a depth of 10ft. were put down on the ridge area where solid quartzite was encountered, two of these holes were fired with explosive. At distances of over 150ft. from the ridge, difficulty was experienced with the drilling due to the presence of clay near the surface. It is therefore not known how wide the ridge of quartzite is, but further work using bulldozer and ripper should be able to determine this.

Yours faithfully,

*M.C. Forster*  
 ( M.C. Forster )  
 Director.
