							as infillings along minute fractures in the dolomite- also generally associated with bright green hydromica? and some carbonate.
173.4m	183.1m		Ec				<u>BRECCIA</u> : Highly brecciated sections contained within highly sheared and highly graphitic black siltstones. The brecciated graphitic fragments set in matrix of pale grey pyritic dolomitic material; entire section extensively permeated with a fine network of carbonate veinlets-associated minor galena-sphalerite.
183.1m	189.6m		Ec				<u>SANDSTONE-SILTSTONE</u> : (finely laminated) pale grey (generally disrupted appearance) plus sections of graphitic highly sheared brecciated siltstone; carbonate veining common throughout but most intensive network of carbonate veinlets occurs within the sheared-brecciated sections. Bedding c/a 186.5m-43°, carbonate vein c/a 185.5m-53°.
189.6m	197.5m		Ec				<u>SILTSTONE</u> : dark grey-black, graphitic,
