From	To	Length Run Core	% Rec.	Sludge Wt.	No.	Assay Value	Summary Geological Log
							graphitic and extensively permeated with random carbonate veinlets and associated sporadic brecciation throughout-occasionally carrying minor blebs/fine veinlets of sphalerite-galena. Section 245.5m-245.7m
							minor sphalerite as blebs in pyrite rich carbonate gangue. Section 240.2m-240.7m
							sandstone dark grey, sheared appearance, extensively permeated with random carbonate veinlets.
251.5m	275.4m		ec				<u>SILTSTONE</u> : Black, highly graphitic and pyritic; extensively permeated with network of carbonate veinlets/fine stringers and commonly associated with abundant pyrite. Section 258.5m-258.8m about 80% Pyrite
							sporadic brecciation throughout over short intervals and consists of black graphitic fragments set in carbonate and commonly carrying abundant pyrite and very minor galena-sphalerite mineralization slately cleavage tends to be developed towards end of section.
273.2m	291.1m		ec				<u>SLATE</u> : Black, pyritic and highly graphitic; minor random carbonate veinlets-stringers generally in association with minor sporadic
