Drilling Record Sheets

Project: EL 7/68 Co-ords. Collar: 22S+18.7W +70' S(Comet) Drill: LY5

Hole No: KH23 Bearing: 70° Bit Size: NQ-72.9m BQ- Bottom

R.L. Site: Depression: 70° Core Size:

Geologist: DISCALA Sampler: DISCALA Date Logged: 10-13/2/73

From	To	Length Run	Length Core	% Rec.	Sludge Wt.	No.	Assay Value	Summary Geological Log
								abundant siderite veins; from 84.13-88.90m and at 104m minor Pbs blebs; from 125.40-126.90m; scattered Zns, Pbs stringlets, seldom up to 1-2cm wide. Pyrite nodules are very abundant. From 147.4m abundant barren, carbonate veins up to 15cm thick. Bedding 60° to c/a at 141.25m
152.05	160.49m							DOLOMITE: greenish. Thin barren carbonate veins.
160.49	196.28m							MUDSTONE, black-SILTSTONE, grey and purple, SHALE black. Layers of SANDSTONE from 179.30m. From 170-172m, carbonate veins with very minor Zns blebs. Intense brecciation from 190.45-193.80m.
196.28	199.74m							BRECCIA, Fragments of siltstone and black slate are enclosed in a dolomitic matrix. Abundant carbonate veins contain pyrite with very minor Pbs blebs.
199.74	230.24m							SLATE, black, graphitic, strongly sheared. Micaceous quartzite layers are interbedded. Bedding is 80° to c/a at 230m. The contact between the Slate-Quartzite sequence (Oonah form) and the overlying rocks of the Crimson Creek form appears to be along a major fault.
