

093

A detailed magnetometer survey defined the Voyager 5 anomaly between lines 11,600N and 12,400N, bounded at the east by 10,500E and to the west by 9,900E. This prominent aeromagnetic anomaly (Geoex 1975) is a series of magnetic highs of about 1000nT amplitude orientated in a north west direction.

A small well developed I.P. anomaly of limited extent was detected at Voyager 5.

Discussion

Significant magnetics together with a coincident I.P. anomaly at Voyager 5 make this prospect worthy of further investigation to the point of verifying the location of the granite contact.
