

(c) Comments

- (i) Results obtained in this test on Composite PC1 were similar to that obtained in Test PC2/F12 for PC2. However, the overall tin rougher concentrate grade was considerably lower in this case as a result of either lower head grade and/or some difference in mineral composition of the two porphyry composite samples.
- (ii) Tin losses in -7 μm slime material of a grind size 100% -75 μm were small and were similar to that resulted from desliming similar ground material for PC2.
