

749050

I.P. anomaly may be an extension of shales located in D.D.H. TYN 1 whereas the eastern low order I.P. anomaly is unexplained due to glacial till cover. This zone which could also be tested by a Jacro mounted percussion drill rig, does not warrant diamond drilling.

6. There are no significant geophysical or geochemical indicators of economic mineralisation north of a N.W.-trending fault (north of the Tyndall Mine), south of line 40N and east of the Henty Fault. The only exceptions being minor disseminated mineralisation in the line 30N pit and Diamond Drill Holes HFZ7 and HFZ 8 associated with siliceous alteration. No further work is recommended in this area.
