

possible correlation between samples S 382, S 383 and S 396 described in report GS 831/82 with samples from drill hole LS 8 was requested. Unfortunately the thin sections for these three samples had already been returned to you by the time samples from drill hole LS 8 were received at AMDEL and, as many of these volcanic rocks are very similar, it is not possible to suggest correlations without comparing the thin sections. Thin sections from drill hole LS 8 will be returned to you and if a microscope is available you may be able to compare these with thin sections from samples S 382, S 383 and S396. If you wish the comparison and suggested correlation to be done at AMDEL, please return all appropriate thin sections.
