geological evidence suggests that the body plunges at 65° - 70° to 290-300 AMG, has a strike direction of 075 AMG and a strike length of at least 60 metres.

The available data suggests that Anomaly 1. is similar in structure, mineralisation style and size to the Sweeneys deposit. Experience in drilling at Sweeneys should therefore be considered when planning further drilling at Anomaly 1. The continued use of downhole geophysics including applied potential surveys is recommended to obtain the maximum information from each drillhole.
