

PROPOSED PROGRAM

Gridding is proposed during the next period with approximately 20 line kilometers to be staked at 400 meter intervals across the prospective Gordon Limestone unit on the Leatherwood, King Billy, Laurel and Amber Creek grids. A further 15 line kilometers is to be restaked in the vicinity of the Amber Creek and Professor Range grids due to Forestry Commission hazard reduction burn offs.

Detailed geologic mapping will continue on the Black Jacks, Mariposa, and Bannockburn prospects with the major emphasis being lithological control (Gordon Limestone) and structure (major cross faulting through the prospective horizon).

Anomalous geochemical trends observed on both the Black Jacks and Mariposa prospects are to be costeanned using a JCB 808 hydraulic
