

Mineralization present restricted to:

- a) veining usually less than 5cm thick of quartz-calcite-pyrite and calcite with flecks of sphalerite-galena. Veins or fault fillings to 0.5m of siderite with minor pyrite were located, these usually very weathered.
- b) carbonate conglomerates with recrystallized calcite-siderite matrix with pyrite disseminated and in blebs.
- c) black siltstone-schist with pyrite as cubes and fine disseminations.
