

### 3.1.2 Results

The hole completed this season, JP3, was drilled using a helicopter supported Hydracore 28 drill rig. A hole summary is given below; for a more detailed log, see Appendix 11 Fig. 3 shows a drill section.

Collar Co-ordinates : (AMG) 5,330,779N, 383,514E

Inclination: -57.0°

Bearing: (AMG) 304°

Depth: 351.0

#### Abbreviated Log:

- 0.0 - 45.6 Quartz-phyric volcanoclastics.
- 212.6 Weakly altered autobrecciated rhyodacitic lavas and pyroclastics.
- 213.6 Shear zone - fault.
- 267.7 Highly chloritic volcanoclastics with minor chalcopryrite.
- 351.0 Moderately altered, autobrecciated rhyodacitic lavas and pyroclastics.

#### Assays

215.0-227.0m (12.0m) 0.08 g/t Au, 0.65%Cu, including:

218.0-223.0m (5.0m) 0.15 g/t Au, 0.82%Cu.

273.0-305.0m (32.0m) 0.06 g/t Au, 0.28%Cu.

The results of the sampling over the mineralised surface are displayed on Fig. 4. These average out to 0.73 g/t Au and 0.09%Cu, the relatively low copper values probably due to the high degree of weathering in the samples. The sampling and drilling results are illustrated on a longitudinal projection in Fig. 5.
