

- b) A broad zone of -80# stream Pb anomaly located between West Jukes Peak and the Currie River. The anomaly is only partly explained minor mineralisation located in massive ignimbritic volcanics in the upper part of drainage. Outcrop in the lower section of the stream with anomaly peak is obscured by fluvioglacials and is unexplained.
- c) The Flannigan's Creek alluvial gold field, source of this detrital gold may be in pyritic and calcareous sediments part of Owen-Eldon Groups. Only two rock chips assayed above the gold detection limit.
