

Creek east of Mt. Ellen. Although this sampling is suspect there is no doubt that some anomalies exist. Anomalous sampling should be checked and extended to include the area south of the King River immediately west of Jukes Proprietry.

4. At the Mountain Maid Twelvetrees reports an adit located 50 m downslope from the trenches with "18" band of ferruginous felsite - assayed 9.dwts gold. This should be located and sampled. In addition stream sediments and mapping should be extended to west and north toward South Conglomerate Creek.
