379 r.s. 0911)	Serpentinite. Antigorite with disseminated relict primary chromiferous (zoned) magnetite. Minor clots, films of cloudy magnesian carbonate.	Weakly sheared/partly recrystallized, but with more or less pervasive coarse pyroxene-derived mesh textures.	Traces ultrafine secondary magnetite. Minor traces ultrafine sulphide.	Serpentinised pyroxenite with affinities to 2977. In contrast, the tremolitic alteration is absent and late carbonation is incipient only.
