The VLF results on line 3600N should be checked to see if 'false' anomalies have been recorded. If they have, then the other suspect lines (listed in the VLF section) should also be checked.

The magnetic interpretations given in this report should be regarded as preliminary (ie, as possible, approximate models) only. In particular, more detailed modelling, using the 12.5m data rather than 25m spaced values used here, should follow the 'high-sensor' and extension magnetic surveys. A residual magnetic map of the Black Hill grid is required to look for magnetic bodies close to the Razorback ultramafics.
