

- 2.4 Sample 3049 probably represents an exhalite horizon.
- 3. Only the quartz microdiorite carries any K-feldspar.
- 4. Because of their rather sodic nature many of the rocks could qualify for the loosely defined names keratophyre and quartz keratophyre, but supporting chemical analyses would be necessary and in any case, the sodic nature is thought to be a product of metasomatic adjustment related to hydrothermal and/or regional metamorphic processes and probably not to an original peculiarity of the magma types.
