SUMMARY AND RECOMMENDATIONS

A total of 822 km of survey was flown in December, 1983, over a property held by Getty Oil Development Company Ltd. near Rosebery, Tasmania.

The survey outlined several discrete bedrock conductors associated with areas of low resistivity. Most of these anomalies appear to warrant further investigation using appropriate surface exploration techniques. Areas of interest may be assigned priorities for follow-up work on the basis of supporting geological, geochemical, and other geophysical information. Due to the numerous cultural features in the survey area, any interpreted bedrock conductors, which occur close to cultural sources, should be confirmed as bedrock conductors prior to drilling.
