

Anomaly 50B

The EM responses at this location indicate that the EM bird flew parallel to a well defined, magnetic bedrock conductor. Note, however, that 50B occurs near a cultural source. The anomaly should be investigated on the ground to establish its significance for the exploration program.

Anomaly 50E-51B

These well defined grade 1 anomalies appear to reflect a magnetic bedrock conductor. Caution must be exercised in the follow-up of this conductor because it may be masked by a nearby culture.

Anomalies 42E-50G,
47D-48xF

A pair of well defined bedrock conductors is indicated by these grade 1 to 3 anomalies. The conductors have produced a narrow conductive zone correlating with a narrow magnetic anomaly, best outlined by the enhanced magnetic.
