McELROY BRYAN & ASSOCIATES PTY LIMITED

REPORT 60/1/14

J.H. BRYAN

OCTOBER 1986

AMG REFERENCE POINTS ADDED

This geological report relates to an area of 109 km<sup>2</sup>, relinquished from E.L. 50/82. The relinquished area is shown on Figure 1. The area formed part of a large coal exploration area and mapping by the Department of Mines (St. Marys 1:50,000 sheet) has now shown that Triassic coal measures do not crop out in the eastern part of the relinquished area (see Figure 1). Mapping and geological traverses of the western part of the area has confirmed that the thin veneer of Lower Permian sediments do not contain coaly material. The Triassic coal measures are now known to be confined to Mt. Durham to the east and Tower Hill to the west of the relinquished area.

In view of the absence of coal measures no drilling was undertaken and no other activities requiring rehabilitation were undertaken.

The previous reports on EL 50/82 do not include any data on the geology of the relinquished area. Further exploration for coal or oil shale is not warranted in the area being relinquished.
